## **EXECUTIVE SUMMARY**

*Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Delta Electricity to undertake a Phase 2 Environmental Site Assessment (Phase 2 ESA) at Mt. Piper Power Station (herein referred to as the "Site") in accordance with the work scope presented in the Preliminary Environmental Site Assessment (PESA; ERM Reference 01947098RP03, 24 July 2013) prepared by ERM.*

*The primary objective for the Phase 2 ESA was to gather soil, sediment, surface water and groundwater data in order to develop a baseline assessment of environmental conditions at the Site, as at or near the time of the transaction. Data obtained during completion of this Phase 2 ESA may also be used to inform future management of contamination at the Site.*

### **Investigation Methodology**

*To achieve the stated objectives, ERM collected soil, sediment, surface water and groundwater samples and submitted those collected samples to environmental laboratories for analysis of Constituents of Potential Concern (COPCs). A Conceptual Site Model (CSM) developed for the Site during the PESA was further refined and the analytical data was compared against published environmental screening values to assess potential risks to human health and the environment.*

*The following conclusions were made based on the data collected during the investigation.*

### **Investigation Outcomes**

- The impacts identified in soil and groundwater at the sites are unlikely to represent a risk to human health and/or the environment given appropriate ongoing management based on the current and continued use of the Site as a Power Station.*
- The key impacts identified included certain metals in groundwater, hydrocarbons and Light non-Aqueous Phase Liquid (LNAPL) in groundwater in the Mobile Plant Refuelling Area and benzene in groundwater near a UST.*
- Certain metals were identified at concentrations in excess of human health and/or ecological screening values across the Site. However the concentrations of metals in groundwater across the Site are generally comparable to background groundwater quality. Where metals were above background concentrations, impact generally appears to be associated with contributions from former mine workings both on the Site and in surrounding areas.*

Site Management and Remediation Requirements

- *No contamination issues were identified which would require material management or remediation based on the current and continued use of the Site as a Power Station with the potential exception of the identified hydrocarbon impacts in soil and groundwater surrounding the Mobile Plant Refuelling Area. On the basis of the data available to ERM at the time of this assessment, the potential for vapour inhalation risks to industrial workers and/or intrusive maintenance workers in this area could not be ruled out. However, ERM understands that the current site operator (Energy Australia) (and prior to the transaction Delta Electricity) has been developing appropriate management approaches in relation to this issue alongside independent consultants and regulators. It is noted that Delta Electricity has previously notified this issue to NSW EPA. It is considered that the costs for management of this issue may be potentially material depending on the remediation / management option selected.*
- *It is recommended that the grit blasting impacts to surface observed in the former contractors' yard in the Non-Operational Area be removed as part of general housekeeping. The costs associated with these works are not anticipated to be material.*
- *Whilst some further assessment may be required to undertake confirmatory sampling in various areas of the Site (refer to "Additional Baseline Data Recommendations" below), it is considered unlikely that costs related to this work would exceed the adopted material threshold for the purposes of this assessment (A\$ 0.5 million).*

Requirements under the Contaminated Land Management (CLM) Act 1997

*With regard to the duty to report contamination which exists under the CLM Act (1997) and the potential for regulation, ERM notes the following:*

- *ERM considers that NSW EPA would most likely continue to manage the LNAPL issue under the existing notification of potential contamination under the CLM Act, however, the additional results should be provided to NSW EPA for review and consideration.*
- *ERM considers that NSW EPA would most likely continue to manage the metals in groundwater issue under the POEO Act (1997) via the Site EPL (including the existing groundwater and surface water monitoring and reporting required as part of the conditions of consent issued under the EP&A Act), and hence would not require formal notification under the CLM Act (1997), however this approach should be confirmed with NSW EPA to ensure strict adherence to the NSW DECC (2009) guidelines. It is noted that NSW EPA could potentially request some modifications to the existing groundwater and surface water monitoring program under the EPL.*

***Additional Baseline Data Recommendations***

*The data presented in this Phase 2 ESA was generally considered to be of a suitable quality and completeness to provide a baseline of environmental conditions at the Site and immediate surrounding receiving environments.*

*On the basis of the outcomes of this investigation, additional characterisation of the baseline conditions at the Site is not considered to be required. It is noted that groundwater impacts associated with Underground Petroleum Storage System (UPSS) infrastructure at the Site were identified independently of this assessment and the current site operator (EnergyAustralia) has been developing appropriate management approaches alongside independent consultants and regulators. On the basis of the outcomes of this Phase 2 ESA, it is considered that further monitoring may be required in these areas as follows:*

- Additional confirmatory groundwater sampling is recommended in AEC MJ (Operational USTs) to confirm the measured concentrations of benzene with specific reference to clarification of the duty to report contamination under Section 60 of the CLM Act (1997).*
- Additional groundwater monitoring and gauging in AEC ME (Mobile Plant Refuelling Area) to confirm the extent of Light Non-Aqueous Phase Liquid (LNAPL) prior to reporting to NSW EPA. This may have already been scheduled at the time of preparation of this report as part of the existing scheduled UPSS monitoring program and/or separate investigations initiated by Energy Australia. It is further recommended that the integrity of the oil pit and the adjacent oil-water interceptor in the Mobile Plant Refuelling Area is investigated.*

## 1 INTRODUCTION

### 1.1 BACKGROUND

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Delta Electricity to undertake a Phase 2 Environmental Site Assessment (Phase 2 ESA) at Mt Piper Power Station. Mt Piper Power Station, herein referred to as “the Site”, is situated approximately 18 km north-north-west of Lithgow in the Central West region of New South Wales. The street address of the Site is 350 Boulder Road, Portland, NSW 2847.

The works detailed herein were completed to support the sale of the Site and in accordance with the work scope presented in the *Sampling Analysis and Quality Plan* [SAQP; ERM Reference 0207423RP01\_SAQP\_DRAFT] (ERM, 2013a), and *Preliminary Environmental Site Assessment* [PESA; ERM Reference 0194708RP03\_FINAL] (ERM, 2013b).

A site location plan is presented as Figure 1 of Annex A. The general Site layout is presented in Figure 2 and Figure 3 of Annex A.

### 1.2 OBJECTIVES

The primary objective for the Phase 2 ESA was to gather soil, sediment, surface water and groundwater data in order to develop a baseline assessment of environmental conditions at the Site and within surrounding receiving environments (including sediments samples from Lake Lyell and Thompsons Creek Reservoir), as at or near the time of the transaction. Data obtained during completion of the Phase 2 ESA may also be used to inform future management of contamination issues both at the Site and in relation to the relevant receiving environments.

### 1.3 MATERIALITY THRESHOLD

For the purposes of this report, a consistent approach regarding the materiality of a contamination issue has been adopted to that utilised in the PESA (ERM, 2013b) which was as follows:

- ERM adopted a materiality threshold of AUD 0.5 M (+ GST if applicable) per contamination source.
- Material costs are those costs for that item to meet relevant requirements of NSW EPA under its current land use to remediate or manage the contamination issue. Remediation or management includes additional assessment, environmental monitoring, management, containment or other remediation measures.

- In addition, any issue that ERM considers could have the potential to lead to prosecution by the regulatory authorities that could lead to significant business disruption or reputational impact will be considered material.

#### 1.4 APPROACH AND SCOPE OF WORK

The adopted approach and scope of works for the Phase 2 ESA works comprised the following general tasks, in accordance with the requirements set out in the *SAQP* (ERM, 2013a):

##### *Preliminaries*

- preparation of a site-specific Health and Safety Plan (HASP) and Environmental Management Plan (EMP);
- assessment of whether suitable monitoring wells exist at the Site, and whether they can be sampled as part of this investigation;
- identification of areas and constituents of potential concern additional to those identified during the *PESA* (ERM, 2013b);
- revision and amendment of the *SAQP* (ERM, 2013a), as necessary;
- engagement of subcontractors including underground utility locator, drillers, laboratories and surveyors;
- scheduling of Site works with Delta Electricity and Energy Australia; and
- completion of site-specific inductions and permitting, as required.

##### *Site Works*

- ground-truthing of proposed sampling locations including clearance of underground services as noted below;
- identification of above and below ground services in the vicinity of drilling locations by reviewing publically available Dial Before You Dig (DBYD) plans and site engineering drawings, and engaging a qualified underground service locator.
- intrusive drilling works and environmental sampling, including soil groundwater, sediment and surface water sampling, in accordance with the requirements of the *SAQP* (ERM, 2013a)

- laboratory analysis of selected soil and groundwater samples for particular constituents of potential concern (COPC) in accordance with the requirements of the SAQP (ERM, 2013a) and as outlined in *Section 4.9*; and
- the survey of newly installed and existing monitoring wells by a registered surveyor to Australian Height Datum (AHD) and Map Grid of Australia (MGA).

*Reporting*

- preparation and submission of weekly progress reports to Delta Electricity; and
- preparation and submission of this Phase 2 ESA report at the completion of works.

1.5

**REPORT STRUCTURE**

This Phase 2 ESA report has been prepared in general accordance with the NSW Environmental Protection Agency (EPA) *Guidelines for Consultants Reporting on Contaminated Sites* (EPA, 1997), as follows:

- *Section 1* - Introduction, background, objectives and scope of works;
- *Section 2* - Site setting including a summary of the Site history and Site conditions;
- *Section 3* - Data quality objectives (DQOs) for the works conducted;
- *Section 4* - Sampling and works methodologies for completing the investigation;
- *Section 5* - Results of the Phase 2 ESA works and Site-specific discussions and recommendations; and
- *Section 6* - Conclusions.

Other key guidelines utilised during completion of this Phase 2 ESA included, but were not limited to:

- Australian Standard (2005) AS 4482.1 *Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 1 – Non-volatile and Semi-volatile Compounds* (Australian Standard, 2005);
- Australian Standard (1999) AS 4482.2 *Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 2 – Volatile Substances* (Australian Standard, 1999);

- Australia and New Zealand Environmental and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) (2000) *Australia and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC/ARMCANZ, 2000); and
- National Environment Protection Council (NEPC) (April 2013) *National Environment Protection (Assessment of Site Contamination) Measure 1999*, NEPC, Canberra, (NEPC, 2013).

A full list of all references is also appended to this report.

## 1.6

### LIMITATIONS

The findings of this report are based on the client-approved SAQP (ERM, 2013a) and the scope of work summarised in *Section 1.3* of this report. ERM performed the services in a manner consistent with the normal level of care and expertise exercised by members of the environmental assessment profession. No warranties, express or implied, are made.

Although normal standards of professional practice have been applied, the absence of any identified hazardous or toxic materials on the subject Site should not be interpreted as a guarantee that such materials do not exist on the Site.

This assessment is based on Site inspections conducted by ERM personnel, sampling and analyses described in the report, and information provided by people with knowledge of Site conditions.

All conclusions and recommendations made in the report are the professional opinions of the ERM personnel involved with the project and, while normal checking of the accuracy of data has been conducted, ERM assumes no responsibility or liability for errors in data obtained from regulatory agencies or any other external sources (with the exception of accredited laboratories engaged by ERM to undertake analysis as part of these works), nor from occurrences outside the scope of this project.

ERM is not engaged in environmental assessment and reporting for the purpose of advertising sales promoting, or endorsement of any client interests, including raising investment capital, recommending investment decisions, or other publicity purposes. The client acknowledges that this report is for the exclusive use of the client, its representatives and advisors and any investors, lenders, underwriters and financiers who agree to execute a reliance letter, and the client agrees that ERM's report or correspondences will not be, except as set forth herein, used or reproduced in full or in parts for such promotional purposes, and may not be used or relied upon in any prospectus or offering circular.

## 2

**SITE SETTING**

Mount Piper Power Station is a large coal-fired Power Station providing base load for the region via two 700 megawatt (MW) generating units. It is situated approximately 18 km north-north-west of Lithgow, in the Central West region of New South Wales (NSW). The Site is located north west of Sydney, between Lithgow and Portland, and is situated approximately 10 kilometres north-west of the Wallerawang Power Station (where a similar Phase 2 ESA has also been undertaken by ERM) as presented in *Figure 1 of Annex A*.

The Site was formerly owned and operated by Delta Electricity (a State Owned Corporation – SOC) however, along with Wallerawang Power Station, has recently been transferred to the ownership of Energy Australia (EA). The Site includes the main electricity generating area and associated coal stockpiles, ash emplacement areas, buffer zones (comprising dominantly native forested areas and open woodland and rehabilitated and revegetated land) and associated water assets as outlined in *Figure 3 of Annex A*.

## 2.1

**SITE IDENTIFICATION**

The approximate coordinates of the Power Station are 223759 m E and 6304970 m S. A Site location plan is provided as *Figure 1 of Annex A*. The total area of the Mount Piper site is approximately 820 hectares and includes:

- the main operational area of the Power Station, which comprises electricity generating activities and the associated coal stockpile;
- the ash emplacement area within a former mine void adjacent to the operational area;
- a buffer zone comprising native forested areas and open woodland and rehabilitated and revegetated land, and including a number of ancillary activities such as transmission line easements and former waste dumps; and
- the associated water assets, Lake Lyell located directly south, and Thompsons Creek Reservoir to the south-east. Water is supplied from off-site storage facilities which are outside the scope of this report.
- The entire area is shown in the Site Layout Plan provided *Figure 3.1 and Figure 3.2, Annex A*.

There are several parcels of land within the Mount Piper “fenceline” most of which are owned and operated by other electricity SOCs and Energy Australia, and these are outside the scope of this report.

The affected parcels consist of:

- a large area of land on the western side of the operational area that was previously transferred for potential future expansion of the Power Station (additional units). ERM's review of NSW government property mapping indicates that the parcel of land appears to consist of Lots 1, 2, 3 and 4 of DP1092737;
- a large triangular parcel of land to the south earmarked for the proposed rail coal unloader. ERM's review of NSW government property mapping indicates that the parcel of land appears to consist of Lots 1 and 2 of DP800003. This is agricultural land and is leased for agricultural use;
- the Power Station's switchyard which is owned and operated by the transmission SOC Transgrid. ERM's review of NSW government property mapping indicates that the parcel of land appears to consist of Lots 1, 2, 3 and 4 of DP1092737;
- a high voltage substation which is owned and operated by the transmission SOC Transgrid. ERM's review of NSW government property mapping indicates that the parcel of land appears to consist of Lot 22 of DP832446; and
- a section of forested land along Boulder Road that has been sold to the Lithgow District Car Club. ERM's review of NSW government property mapping indicates that the parcel of land appears to consist of Lot 1 of DP1127747.

For the purpose of this assessment, the Site has been divided into 13 individual areas of environmental concern (AECs), according to usage and the presence of potential sources of contamination. These areas, listed in *Table 2.1*, are discussed in detail in the *PESA* (ERM, 2013b).

**Table 2.1** *Summary of Areas of Environmental Concern*

## 2.2

### *SITE HISTORY*

Construction of Mount Piper Power Station began in 1984, was halted in 1986 and began again in the early 1990s, with the station commissioned in 1993. Substantial earthworks were required to level the land and backfill a former open-cut mine which was historically operated on the Site.

Based on historical mining maps (CDM Smith, 2012; PPK Environment & Infrastructure Pty Ltd, 2000) open-cut mines were present beneath the current operational areas of the power station. These voids are understood to have been backfilled with overburden at the end of mining operations and are presented in *Figure 4, Annex A*. Site management advised during the completion of the Preliminary Environmental Site Assessment (PESA) that there have been no substantial changes to the building footprints and the current operational areas are representative of operations over the period from 1993 to 2013. There are three landfills which date from the early years of construction and operation of the station, as shown in *Figure 3.1, Annex A*.

Further information regarding the history of the Site, including historical aerial photographs, zoning and environmental approvals, licenses and management is presented in the *PESA* (ERM, 2013b).

## 2.3

### *SURROUNDING ENVIRONMENT*

The Site is surrounded by areas used mainly for mining purposes with some grazing, recreational and commercial forestry activities in the locality. Ben Bullen State Forest neighbours the site to the north and south-east.

Key industrial uses in the area are:

- Wallerawang Power Station located approximately 7 km to the south-east.
- existing and former coal mines surrounding the site (including Centennial Coal mine immediately east of the Site) and within the site footprint;
- the former Portland cement works are located 4 km to the west.

The closest residential areas to the Site include:

- rural residences that do not form part of residential centres. The closest identified residential property is located at 28 Jarrah Way, Portland. The identified property is located adjacent the buffer lands on the north-western site boundary, and approximately 2 km west of the Mt Piper operational area;
- Portland, approximately 4 km to the west. Two schools, one child care facility and a hospital are located within 5 km of the Power Station, all of these are situated within the town of Portland.
- Blackmans Flat approximately 3 km to the east.
- Cullen Bullen, approximately 6 km to the north.
- Lidsdale approximately 6 km to the south-east.
- Angus Place approximately 7 km to the north-east.
- Wallerawang, approximately 10 km to the south-east.

## 2.4

### TOPOGRAPHY

The Site lies at an elevation of between 925 and 960 m Australian Height Datum (AHD) within a valley created by ridges forming a U-shape to the east, south and west. The floor of the valley has been levelled to construct the Power Station. The U shaped ridges surrounding the site rise to elevations of about 1000 m approximately 1 km to the south, east and west of the centre of the Mount Piper Power Station, whilst to the north the surrounding hills peak around 1000 m approximately 3 km from the centre of the power station. Hilly forested country lies across the Castlereagh Highway to the north.

## 2.5

### GEOLOGY

#### *Regional Geology*

The Site is located on the western edge of the Sydney Basin which is characterised by easterly dipping sedimentary deposits. The *Western Coalfield Regional Geology (southern part) 1:100 000 Geological Map, 1<sup>st</sup> Edition* (Yoo, 1992) indicates that the site is underlain by the Permian age Illawarra Coal Measures comprising interbedded shale, sandstone, conglomerate and coal. This map further indicates the Narrabeen Group, comprising claystone, shale and sandstone, overlies the Illawarra Coal Measures and outcrops at high elevations across the Site within the buffer land.

North-south trending faults, and north-east to south-west lineaments are featured in the region. Two faults (position accurate) (Yoo, 1992) are reported to dissect the northern and southern site boundaries, passing through the former contractors yard and the operational area in the southern portion of the site and the coal storage area in the northern portion of the site.

Surrounding the site, the Narrabeen Group features in the Ben Bullen State Forest (which forms part of the Great Dividing Range) north east of the site. Permian age sandstone, shale and conglomerate of the Shoalhaven Group underlie the Illawarra Coal Measures and are located south and west of the site.

*Local Geology*

A description of the local geology based on environmental investigations conducted in the vicinity of the Site cited by CDM Smith (2012) is provided in Table 2.1.

**Table 2.2** *Description of Local Geology<sup>1</sup>*

<b>Stratigraphic Unit</b>	<b>Geological Formation</b>	<b>Description</b>	<b>Approximate Thickness (m)</b>	
Illawarra Coal Measures	Irondale Coal Seam	Coal, mainly bright, claystone, black carbonaceous and also buff	1.3-1.4 <sup>2</sup>	
	Long Swamp Formation	Silty sandstone Sandstone, siltstone and shale	1 - 1.5 12 - 14	
	Lidsdale Coal Seam	Coal, carbonaceous shale and sandstone	1.1 - 1.8	
	Blackmans Flat Conglomerate	Sandstone (medium to coarse grained) with interbedded siltstone	3 - 6	
	Lithgow Coal Seam	Coal, carbonaceous shale	1.9 - 2.3	
	Marrangaroo Conglomerate	Siltstone, mudstone and shale Sandstone with siltstone bands and some boulders	0.3 - 0.6 3.5 - 4.6	
	Shoalhaven Group	Berry Formation	Siltstone or silty sandstone, some pebbles.	>30

- 1 Table modified from (CDM Smith, 2012)
- 2 (Geoscience Australia)

Coal seams within the Illawarra Coal Measures have been widely mined in the region, and sections of the site are underlain by abandoned coal workings (both underground and backfilled open cut) from mining of the Lidsdale and Lithgow seams. The Lidsdale and Lithgow coal seams converge approximately one kilometre north-east of the Site. The Irondale Coal Seam has also been mined at higher elevations to the west in the Pipers Flat area.

The surface geology across the site has been extensively disturbed by mining activities. Voids created during open-cut mining were backfilled with overburden (CDM Smith, 2012), which likely included a mixture of coarse fragments (gravels, cobbles and boulders) of shale, siltstone, mudstone and sandstone. Geological features of the Site are presented in *Figure 4 of Annex A*.

Both the existing and the Lamberts North Ash Repository are located within former open cut mines. Both open cut mine workings extended to the base of the Lithgow Seam. Whilst approximately 1 m of fill material was placed at the base of the existing ash repository prior to ash deposition, 5 m of fill material was placed at the base of the Lamberts North ash repository prior to ash deposition (SKM, 2010).

Local geology specific to various areas of the Site, as encountered during the current drilling program, are discussed further in *Section 5.1* of this report.

## 2.6

### *HYDROGEOLOGY*

#### *Regional Hydrogeology*

Information on regional aquifer properties is limited as most investigations in the area have focussed on shallow aquifers (CDM Smith, 2012). No regional scale productive aquifer has however been identified in the vicinity of the Site. Large scale regional groundwater flow is expected to be towards the north/east, following the dip of the sedimentary deposits.

#### *Local Hydrogeology*

CDM Smith (2012) inferred that two aquifers are present beneath the site. Based on groundwater investigations associated with the Ash Repositories in the north-eastern portion of the site, a shallow aquifer is located at approximately 915 m AHD and flows in a north-easterly direction. Locally there may however be different directions in groundwater flow due to local variations in topography and surface water interactions. It is noted that between 2004 and 2012, groundwater levels of the shallow aquifer fluctuated up to 5 m with rainfall (CDM Smith, 2012). A deeper intermediate aquifer present at approximately 885 m AHD and within the Marrangaroo Conglomerate flows in a south-easterly direction. These aquifers are reportedly not connected.

Limited information is available regarding the north-south trending faults through the contractors yard, operational area, and coal storage area. Depending on the type, displacement, and whether infilling has occurred, the fault may connect the shallow and intermediate aquifers, or create a barrier between groundwater across the site.

Historic mining activities have had a significant impact on the groundwater regime underlying the site, impacting aquifer properties and groundwater flows. Where underground workings have been left in place, hydraulic conductivities as high as 5 to 50 m/d have been reported for the disturbed coal seams (Merrick, 2007), as cited in (CDM Smith, 2012).

A hydrogeological investigation (HLA Envirosiences, 2004) for the proposed Blackmans Flat Waste Management Facility (located directly down-gradient of the Site) reported an approximate hydraulic conductivity of  $10^{-1}$  m/d for the material used for backfilling of the open cut mine voids and approximately  $10^{-3}$  m/d for the Marrangaroo Conglomerate underlying the Lithgow seam. Groundwater seepage has been observed in remaining mine voids (such as the Huon Void/Pond, formerly known as the Groundwater Collection Basin).

Considering the above, the base of the open cut fill materials are considered to present the shallowest laterally extensive groundwater bearing unit at the site in locations of former open cut mining. Localised perched shallow groundwater has been noted in various groundwater monitoring wells installed for the purpose of assessing potential contamination from Underground Petroleum Storage Systems (UPSS). In areas where former underground mines remain in place, the disturbed coal seams are considered to present the shallowest laterally extensive groundwater bearing unit.

Details of hydrogeological conditions encountered during this Phase 2 ESA are summarised in *Section 5.1*.

## 2.7 GROUNDWATER USE

A search of publically listed boreholes on the *NSW Natural Resource Atlas* (NSW Government) 27 registered groundwater bores were identified within a 3 km radius of the site. These bores are registered for monitoring, industrial, irrigation, domestic and stock uses. Details of these industrial, domestic and stock bores are listed below in *Table 2.3*.

**Table 2.3 Registered Groundwater Bores in Proximity to the Site**

Bore ID	Distance from Power Station <sup>1</sup> (km)	Direction from site	Water Bearing Zone(s) (m)	Registered Use
GW053719	2.2km from Ash Repository	North East	-	Industrial
GW106737	2.5 km from Ash Repository	South East	84.0 – 84.5 5 (SWL – 33m)	Domestic
GW111942	2.9 km from Coal storage area	North	3-3.1 27-27.1 43-43.1	Industrial
GW802266	2.8 km from operational area	West	-	Domestic Stock

<sup>1</sup> Measured from the closest AEC

One groundwater bore is registered for domestic water supply purposes down-gradient of the site. This bore (GW106737) was installed across a shale water bearing zone at 84 m bgl and is considered to intersect the deeper aquifer. A second bore registered for industrial use (GW053719) appears to be installed within the Angus Colliery, owned by Centennial Coal. If groundwater flow in the area is dominated by local geology and flows in a north easterly direction, this bore may intersect the same water bearing unit which passes through the Mt Piper Power Station.

## 2.8

*HYDROLOGY*

The site is located within the Upper Cox's River Catchment. The main hydrological features in the area are shown on *Figure 1 of Annex A* and can be summarised as follows:

- Coxs River located approximately 2.5 km east from the site boundary. This is the main hydrological feature in the area. The Coxs River runs from north to south, and is dammed at Lake Wallace and Lake Lyell to provide water supply for the Delta Electricity Power Stations. The lakes are also used for other purposes including public recreation such as boating and fishing. The river ultimately flows to Lake Burragorang which stores much of Sydney's drinking water supply;
- Western Drain located within the site on the western boundary of the operational area. This diverts runoff from the hills above the site along the western boundary and into Neubecks Creek;
- Neubecks Creek (also known as Wangcol Creek) located immediately to the north of the site. Neubecks Creek drains from the area west and north of Mt Piper Power Station to join the Coxs River north of Lidsdale;
- Pipers Flat Creek located approximately 1.5 km south of the site boundary, running from west to east beyond the forested ridge behind the site; and
- Thompsons Creek Reservoir located approximately 8 km south-west from the site boundary of Mt Piper. This dam impounds Thompsons Creek to supply water to the Delta Electricity Power Stations. As the dam has a small catchment it is supplemented with water from Lake Lyell. It is used recreationally for trout-fishing. Thompsons Creek appears to run south to north joining Pipers Flat Creek (mentioned above).
- Hydrological features are presented in *Figure 1 of Annex A*.
- Surface water drainage has recently been diverted from the former Huons Gully located along the western edge of the area formerly mined by Centennial Coal in the recently purchased Lamberts North area. The drainage line formerly included a surface water pond known as Huons

Void, or the Groundwater Collection Pit which has now been filled and is understood to not directly discharge to Neubecks Creek.

### 2.8.1 *Lake Lyell*

The Coxs River was dammed downstream of Lake Wallace to form the Lake Lyell reservoir in 1982. Lake Lyell has an active capacity of approximately 31 GL, sourced from local runoff. The water is also pumped to off-stream storage at Thompsons Creek Reservoir, which supplies Mt Piper, or to Lake Wallace, which supplies Wallerawang Power Station.

At the time of preparation of the PESA three local farmers held agreements with Delta to agist stock within the buffer lands around Lake Lyell. It is further understood that these agreements were transferred to Energy Australia along with the sale of the Site. Lithgow City Council also owns a portion of lands adjacent to Lake Lyell, as well as leasing additional lands which are publicly accessible for camping and recreation areas.

### 2.8.2 *Thompsons Creek Reservoir*

Thompsons Creek Reservoir was constructed in 1992 on a small creek to provide off-stream storage for supply of the water to Mt Piper and Wallerawang. Although the surface runoff catchment of Thompson Creek is relatively small, Thompsons Creek Reservoir has a storage capacity of up to 27.5 GL with water routinely pumped from Lake Lyell.

The reservoir is also available to the public for recreational fishing, however other recreational activities (swimming / boating etc) are not permitted. Surrounding buffer lands are generally vacant vegetated lands, with some areas used for stock grazing by local farmers under agreements with Energy Australia.

## 2.9 *SENSITIVE RECEPTORS*

Sensitive receptors relevant to the Site identified as part of the SAQP (ERM, 2013a), included:

- indoor and outdoor human health receptors in the form of industrial workers;
- intrusive maintenance workers;
- residential receptors and potential groundwater users;
- recreational users of Lake Lyell (the closest surface water body where recreational access is currently approved);
- aquifers beneath the Site and nearby potable water wells; and

- ecological receptors, including freshwater ecological receptors in the local creeks, Lake Lyell, the Neubecks Creek and the Coxs River.

**2.10 POTENTIAL AND KNOWN SOURCES OF CONTAMINATION**

The following potential and known sources of contamination were identified as part of the PESA (ERM, 2013b):

- Former Mine and Backfilling of Operational Area (contamination of soil and groundwater from historical activities, or use or impacted fill material);
- Former Landfills (potential leaching from landfilled materials);
- Coal Storage Area (potential leaching from stockpiled coal);
- Electrical Transformers (potential leaks of transformer oil)
- Water Holding Ponds (potential leaks of ponds);
- Workshops (potential leaks of solvents);
- Mobile Plant Refuelling Area (potential fuel leaks);
- Operational USTs (potential fuel leaks);
- Operational ASTs (potential chemical and/or fuel leaks);
- Current Ash Repository (leachate);
- Lamberts North Ash Repository (leachate); and
- Lake Lyell and Thompsons Creek Reservoir (sediments may have accumulated contaminants from Mt Piper Power Station drainage and discharges).

Subsequent to the issue of the PESA (ERM, 2013b) the Site has self-notified groundwater contamination to NSW EPA under Section 60 of the CLM Act. The following details are listed on the NSW EPA register of contaminated sites:

**Table 2.4 Mount Piper Notification to NSW EPA under the CLM Act**

Suburb/ City	Site description and address	Activity that caused contamination	s60 form received?	EPA initial assessment	EPA site management class
Portland	Mt Piper Power Station 350 Boulder Road	Other Petroleum	Yes	In progress	B - The EPA is awaiting further information to progress its initial assessment of this site.

### 3 DATA QUALITY OBJECTIVES

Data quality objectives (DQOs) were developed to define the type and quality of data required to achieve the project objectives outlined in *Section 1.2* of this report. The DQOs have been prepared in line with the seven-step approach outlined in National Environment Protection (Assessment of Site Contamination) Measure 1999 (NEPC, 2013), and with reference to relevant guidelines published by the NSW EPA, ANZECC/ARMCANZ, and NEPC.

The DQO process is validated, in part, by the Quality Assurance and Quality Control (QA/QC) procedures and assessment, summarised in *Section 5.6* and presented as *Annex F* of this report.

The seven steps of the DQO process, and how they were applied to this assessment, are presented in the following sections.

#### 3.1 STEP ONE: STATE THE PROBLEM

A statement of the problem is provided by the particular objectives of the assessment as stated in *Section 1.2*. Background information is provided in *Sections 1* and *2* of this report, and via the conceptual site model (CSM) provided in *Annex C* which was developed as part of the SAQP (ERM, 2013a).

#### 3.2 STEP TWO: IDENTIFY THE DECISION

##### *Decision Statements*

The principal decision to be made is:

- Are there actual or potential material contamination issues relevant to the sale of the Mt Piper Power Station?

Additional decisions to be made include:

- Is there sufficient data to provide an environmental baseline at the time of the transaction?
- What is the nature and extent of soil, surface water and groundwater impact on or beneath the Site?
- What is the nature and extent of sediment and surface water and impact to Lake Lyell and Thompsons Creek Reservoir?
- Does the impact at the Site represent a risk to human health, based on the current and continued use of the site?

- Is the impact at the Site likely to warrant notification and / or regulation under the *NSW Contaminated Land Management Act, 1997*?
- Is material remediation likely to be required?

Adopted screening values and waste classification guidelines which will assist in making some of these decisions are identified below in *Section 3.5.2*.

### 3.3 *STEP THREE: IDENTIFY INPUTS TO DECISION*

The inputs required to make the above decisions are:

- existing relevant environmental data, taking into consideration the number and location of existing soil and groundwater sampling locations, the construction of existing groundwater monitoring wells and the date of the most recent sampling events;
- direct measurement of environmental variables including soil/sediment type, soil gas concentrations, odours, staining, water strike, groundwater level and water quality parameters;
- collection and laboratory analysis of soil, groundwater, sediment and surface water samples for identified COPCs;
- field and laboratory QA/QC data; and
- comparison of data against adopted screening values and waste classification guidelines (outlined in *Section 3.5.2*).

### 3.4 *STEP FOUR: DEFINE THE STUDY BOUNDARIES*

#### *Spatial Boundaries*

The site location and description is provided in *Section 2*. Figures identifying the site boundary and investigation areas are presented in *Annex A*. The physical spatial boundaries of the investigation included the surface and subsurface soils as well as groundwater beneath the site. Vertical boundaries of the investigation were limited to the depth of borehole advancement.

#### *Temporal Boundaries*

Temporally, the study is intended to provide a baseline assessment of the nature and extent of contamination at the Site, and in relevant receiving environments, as at or near the time of completion of the transaction to the extent practicable.

*Constraints within the Study Boundaries*

Constraints on the delivery of the objectives of the Phase 2 ESA program within the study boundaries may include:

- location of underground services or infrastructure; and
- the condition of existing monitoring wells.

## 3.5

**STEP FIVE: DEVELOP A DECISION RULE**

The DQOs were designed to facilitate the collection of adequate soil and groundwater data to address the decisions in Step 2 of the DQO process. During the course of the project, various constraints had varying impact on the implementation of the Phase 2 program. Examples of these constraints included restrictions of siting investigation locations due to physical access or to the presence of sub-surface services and or depth constraints due to the presence of shallow bedrock. Deviations from the Phase 2 program were tracked during the course of the investigation via the weekly progress spreadsheet and were communicated to the relevant project stakeholders. An extract of the weekly progress spreadsheet is provided below as *Table 3.1* which highlights locations proposed but abandoned during the course of the investigation.

The proposed Phase 2 program included soil samples from 183 locations and groundwater samples from 97 locations. The completed Phase 2 program included soil samples from 187 locations and groundwater samples from 77 locations. A detailed comparison of the proposed and completed investigation locations for each AEC along with explanations for changes is provided in *Table 8 of Annex B*.

Where access constraints were identified, boreholes and monitoring wells were moved (where possible to nearby locations) and where drilling was not feasible, surface soil samples were collected to assess direct contact pathways. In areas which could not be accessed for drilling, monitoring wells were located around the perimeter of the inaccessible area where possible. The distribution of monitoring wells around the perimeter provides an understanding of groundwater conditions up-gradient and down-gradient of the relevant AECs to assess the potential extent of contamination and identify potential for migration of contaminants. It is therefore considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment.

At the beginning of the Phase 2 program the conceptual site model (CSM) was revised in AECs MA (Former Landfills) and ML (non-operational areas) which resulted in changes to the SAQP in these AECs. The previous CSM for these AECs was based on a soil profile with capacity for shallow groundwater and potential contamination sources limited to surface activities such as maintenance and storage. Field observations indicated that the soil profile was shallow (<0.5 m bgl) or non-existent across most of the buffer lands on elevated terrain to the north and west of the main operational area. Initial drilling confirmed that groundwater was present at depths greater than 20 m bgl within rock strata. The density of monitoring wells was therefore reduced, as contamination, if present, would likely be present at the surface (<0.5 m bgl) and therefore is unlikely to migrate to groundwater at depths of greater than 20 m bgl. Access to areas within AECs MA (Former Landfills) and ML (non-operational areas) was also limited due to difficult access in terrain and dense vegetation, and the presence of overhead power lines restricting drilling locations. Irrespective of these constraints, it is considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment.

The main constraint on the implementation of the Phase 2 program within the main operational area (AEC MK and MI) was the presence of underground utilities and other operational hazards including traffic. It is considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment.

At the beginning of Phase 2 program the SAQP for the AECs MG (current ash repository) and MH (Lamberts North Ash Repository) were revised to account for the operational constraints at the time of sampling, however, it is considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment

**Table 3.1** *Mt Piper Phase 2 Investigation Location Abandonment*

AEC	Location	Location Type	Comments
MA	MA_MW02	Monitoring Well	Monitoring well abandoned due to change in conceptual site model. *
MA	MA_MW04	Monitoring Well	Monitoring well abandoned due to change in conceptual site model*.
MA	MA_MW06	Monitoring Well	Monitoring well abandoned due to change in conceptual site model*.

COMMERCIAL IN CONFIDENCE

AEC	Location	Location Type	Comments

ML	ML_MW16	Monitoring Well	Monitoring well abandoned due to change in conceptual site model*. Sufficient investigation locations within the former Contractors Yard.

Notes:

\* See discussion in text above. The SAQP was revised in the field at the beginning of the Phase 2 program and it is considered that sufficient coverage was achieved.

### 3.5.1

#### *Field and Laboratory QA/QC*

The reliability of soil, sediment, surface water and groundwater data was assessed based on comparison with acceptable limits for field and laboratory QC samples outlined in relevant guidelines made or approved under the *NSW Contaminated Land Management Act 1997*, including the *ASC NEPM (NEPC, 2013)*. In the event that acceptable QC limits were not met, the field observations of the samples were reviewed and if no obvious source for the non-conformance was identified (such as an error in sampling, preservation of sample(s) or heterogeneity of sample(s), etc.) liaison with the laboratories was undertaken in an effort to identify the issue that had given rise to the non-conformance.

A summary of the QA/QC procedures and assessment is presented in *Section 5.9* and *Annex F* of this report.

### 3.5.2

#### *Screening Values*

Individual soil and groundwater data, along with the maximum, minimum, mean, standard deviation and 95% upper confidence limit (UCL) of the mean concentration (if required) were compared to adopted screening values.

Exceedence of adopted screening values does not necessarily indicate the requirement for remediation and/or a risk to human health or the environment. If individual or 95% UCL concentrations exceeded the adopted screening values, consideration of the extent of the impact, the potential for receptors to be exposed to the impact, and regulatory compliance was considered.

The adopted screening values have generally been sourced from guidelines made or approved under the *Contaminated Land Management Act 1997*, which includes the ASC NEPM (NEPC, 2013). Where alternative sources have been utilised, appropriate justification has been provided.

#### *Soil Screening Values*

Soil data was assessed against investigation criteria published in the following documents:

- NEPC (2013) *National Environment Protection (Assessment of Site Contamination) Measure 1999*, Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater. Health Investigation Level (HIL) 'D' - Commercial/Industrial HIL 'C' - Public Open Space and Ecological Investigation / Screening Levels (EILs/ESLs) (as applicable). It is noted that laboratory analysis for pH and CEC is required to establish site specific EILs/ESLs, and an assessment of background conditions may be necessary. The establishment of EILs/ESLs was undertaken, and sample locations in up-gradient non-operational areas were utilised in establishing background conditions; and (NEPC, 2013);
- Application of the HILs will be considered on a case by case basis in accordance with the NEPM 2013 amendment to reflect local conditions encountered at the time of the intrusive works. Health Screening Levels for Vapour Intrusion and Direct Soil Contact (HSL) 'D' - Commercial/Industrial and Health Screening Levels for Vapour Intrusion and Direct Soil Contact Intrusive Maintenance Worker (Shallow Trench) will also be adopted; and
- Where applicable, the guidance provided in the Western Australia Department of Health (2009) *Guidelines for the assessment, remediation and management of asbestos-contaminated sites in Western Australia* has been adopted in relation to asbestos as referenced by the ASC NEPM (NEPC, 2013). This included consideration of the site-specific circumstances and the likely management and/or remediation approach (where required).

#### *Groundwater and Surface Water Screening Values*

Water data will be assessed against investigation criteria published in NEPC (NEPC, 2013) *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013 (No. 1)*, Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater, which references the following guidance:

- ANZECC and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) (2000) *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*. Trigger values for fresh water, level of protection 95% species and level of protection 99% species (for bioaccumulation of mercury and selenium); (ANZECC/ARMCANZ, 2000)
- National Health and Medical Research Council (NHMRC) and National Resource Management Ministerial Council (NRMMC) (2013) *Australian Drinking Water Guidelines Paper 6 National Water Quality Management Strategy*; (NHMRC, 2013)
- NHMRC (2008) *Guidelines for Managing Risks in Recreational Waters* (note that these will be applied with reference to NHMRC and NRMMC 2013 - referenced above); and (NHMRC, 2008)
- Cooperative Research Centre for Contamination Assessment and Remediation of the Environment (CRC CARE) (2011) *Technical Report No. 10, Health Screening Levels for Petroleum Hydrocarbons in Soil and Groundwater*. Health Screening Levels for Vapour Intrusion (HSL) 'D' - Commercial/Industrial and Health Screening Levels for Vapour Intrusion - Intrusive Maintenance Worker (Shallow Trench). (Friebel, 2011)

#### *Sediment Screening Values*

Sediment quality data will be assessed against screening values published in:

ANZECC / ARMCANZ (2000) *Australian and New Zealand Guidelines for Fresh and Marine Water Quality - Interim Sediment Quality Guidelines (ISQGs)*, or the equivalent Commonwealth of Australia (DEWHA, 2009) *National Assessment Guidelines for Dredging*. (ANZECC/ARMCANZ, 2000)

### **3.5.3 *Appropriateness of Laboratory Limit of Reporting***

Comparison of the laboratory Limit of Reporting (LOR) to the screening values has been undertaken confirming that the screening values are less than the laboratory LOR with the exception of the following compounds:

- Some volatile organic compounds in water (including vinyl chloride, chloromethane, bromomethane, 1,2-Dichloroethane, hexachlorobutadiene, 1,2,3-trichlorobenzene and 1,2-dibromomethane) and pentachlorophenol have LORs marginally above the adopted ecological protection criteria and/or above the drinking water guidelines. With the exception of vinyl chloride, it is noted that these contaminants are not regarded as key contaminants of concern and no drinking water receptors have been identified within the vicinity of the Site. In the event that a detection of these compounds is noted, further investigation and/or explanation may be required. As vinyl chloride is a breakdown product of PCE and TCE, detections of these compounds may trigger the need for further consideration;

- PAHs in water, including Benzo(a) pyrene and Carcinogenic PAHs (as BaP TEQ), have LORs above the drinking water and recreational guidelines. The LORs are within the same order of magnitude as the recreational screening value and an order of magnitude above the drinking water guideline - noting that no drinking water receptors have been identified in the vicinity of the site. A detection of either of these compounds may require further investigation and / or explanation, and should take into consideration concentrations of other volatile TRH fractions.
- Selenium and mercury in water have LORs marginally above the adopted 99% freshwater ecosystem protection guideline. This guideline has been adopted as a precautionary approach and it is noted that the LOR is below the 95% guideline value. A detection of either of these compounds may require further investigation and/or explanation.
- Several PAHs in sediments have LORs marginally above the ISQG-Low, and on occasion, above the ISQG-High. However it is noted the LOR for total PAHs was below the ISQG-Low. The laboratory reported that standard LOR could not be achieved due to the moisture content of the samples.

### 3.6

#### *STEP SIX: SPECIFY LIMITS ON DECISION ERRORS*

The acceptable limits on decision errors applied during the review of the results will be based on the data quality indicators (DQIs) of precision, accuracy, representativeness, comparability and completeness (PARCC) in accordance with (NEPC, 2013) *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013, Schedule B3 - Guideline on Laboratory Analysis of Potentially Contaminated Soils*.

The potential for significant decision errors was minimised by:

- completing a robust QA/QC assessment of the validation data and application of the probability that 95% of data will satisfy the DQIs, therefore a limit on the decision error would be 5% that a conclusive statement may be incorrect;
- assessing whether appropriate sampling and analytical density has been achieved for the purposes of providing a baseline of soil, sediment and groundwater conditions at the point of transaction; and
- ensuring that the criteria set was appropriate for the ongoing use of the site as a power generation facility.

3.7

*STEP SEVEN: DEVELOP (OPTIMISE) THE PLAN FOR COMPLETING THE WORKS*

The DQOs have been developed based on a review of existing data and discussions with Delta Electricity. If data gathered during the assessment indicated that the objectives of the assessment programme were not being met, the sampling design (including sampling pattern, type of samples and analytes) was adjusted accordingly using feedback (where necessary) from project stakeholders.

## 4 SAMPLING METHODOLOGY

### 4.1 RATIONALE

Based on a review of the available data and the establishment of potential AECs, the most appropriate sampling design to achieve the stated project objectives was considered to be primarily based on a judgemental (targeted) sampling program, which in itself provides good coverage of operational areas or areas, and minimal additional sampling undertaken to provide spatial coverage for low risk areas of the site (eg buffer lands) or to fill material data gaps within the CSM. It is noted that intrusive investigations were limited to areas where access and site activities enabled investigations to occur without unacceptable health and safety risks to personnel and/or unacceptable disruption to site operations. The sampling plan was discussed with site management prior to the commencement of works to assess this risk and was subject to minor alteration (refer to *Table 3.1*).

Given the scale of the site, different sampling densities were adopted based on estimated contamination risk and logistical constraints of different areas of the site. The sampling approach was generally in accordance with the NSW EPA *Sampling Design Guidelines* (NSW EPA, 1995) which does not recommend a minimum number of sampling points for sites larger than 5.0 ha. The NSW EPA *Sampling Design Guidelines* (NSW EPA, 1995) recommends four sampling patterns; judgemental, random, systematic and stratified. As recommended in these guidelines, a stratified sampling pattern was adopted whereby the Site was divided into smaller areas of environmental concern (AECs) based on a review of historical activities and identified potentially contaminating activities.

A combination of systematic and judgemental sampling patterns was therefore adopted within each AEC to both target specific potential point sources (e.g. fuel storage tanks) and to provide sufficient lateral coverage. The exception to this was sampling within the operational area, for which a grid-based systematic approach was adopted. The sampling densities adopted are considered appropriate for the purpose of this assessment.

The sampling pattern and density was limited by the constraints on drilling (as discussed in *Section 3.3*), however a systematic approach was achieved with monitoring wells were located down-gradient of inaccessible areas where feasible. Whilst there remains potential for localised areas of contamination to exist, the network of monitoring wells is considered to be sufficient to establish the presence of potentially material contamination by delineating the maximum extent of potential impacts.

It is therefore considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment within the constraints previously discussed and identified within the SAQP (e.g. subsurface utilities).

Final investigation locations are presented in Figures 5.1 to 5.7 of Annex A.

## 4.2 *SITE INSPECTION*

The work areas of the Site were inspected and the soil and groundwater sampling locations were marked out to target identified Site features and potential contamination sources. At the same time as clarifying the investigation locations, sub-surface utilities were marked out using an appropriately qualified service locator. Ground penetrating radar (GPR) and cable avoidance tool (CAT), along with DBYD plans and Site engineering drawings were utilised to identify underground services and utilities.

## 4.3 *SOIL INVESTIGATION*

### 4.3.1 *Soil Sampling Procedure*

Soil investigation and sampling works were undertaken in general accordance with ERM's Standard Operating Procedures (SOPs). The location and number of sampling locations are presented within *Figures 5.1 to 5.8 of Annex A* and listed by AEC (Area MA - Area MM) in *Table 1 of Annex B*. Where practicable, all boreholes were advanced to an initial depth of 1.5 m bgl using either hand augering or Non-Destructive Digging (NDD) techniques in accordance with ERM's sub-surface clearance procedures. Drilling and soil sampling of subsurface material beyond 1.5 m bgl, were undertaken using a Geoprobe® drilling rig with a continuous push tube sampler where conditions allowed. Other methods of borehole advancement included solid stem mechanical augering, and air rotary methods, where bedrock was encountered or subsurface material could not be penetrated using push tube methods.

Regardless of the drilling methodology adopted, soil sampling techniques which minimised the potential for loss of volatiles were utilised. Where the collection of undisturbed samples was not possible (eg during hand augering) the potential for loss of volatiles was minimised by sampling from larger clods and minimising the duration between sample excavation and placement into the sample container.

Field screening was conducted in accordance with ERM's SOPs using a photo-ionisation detector (PID) fitted with a 10.6 eV lamp, calibrated at the beginning of each working day. Calibration certificates are presented in *Annex E*. Where practicable, soil was collected at 0.5 m depth intervals (or where significant changes in lithology were identified) to 2 m bgl and at 1 m depth intervals thereafter. Soil samples were placed in a zip lock bag, sealed and screened for the presence of ionisable volatile compounds. Where the presence of volatiles or other impact was suspected, additional samples were collected.

Soil properties were logged by an appropriately trained and experienced field scientist in general accordance with *Australian Standard AS 1726-1993, Geotechnical Site Investigations* (Standards Association of Australia, 1993). Representative soil samples were collected for laboratory analysis at selected locations, based on visual and/or olfactory evidence of the following:

- multiple layers of fill material;
- changes in the soil profile; and
- potential impact.

Soil samples were collected, to the extent practicable, in accordance with techniques described in *Australian Standard AS4482-2005* (Parts 1 and 2) to maintain the representativeness and integrity of the samples. Soil samples for laboratory analysis were collected from either the hand auger or directly from the push tube core. No samples were collected for laboratory analysis from solid flight augers, unless otherwise stated within borehole logs presented in *Annex D*. The frequency and nature of field QA/QC samples collected during the assessment works are summarised in *Annex F*.

Soil samples were generally labelled using the nomenclature presented in *Table 4.1*(below).

**Table 4.1** *Sample Naming Protocol*

<b>Sample</b>	<b>Identification</b>
Sample taken from shallow hand auger soil bore or deeper soil bore, SB01 at depth of 0.5 m bgl, within work area MA	MA_SB01_0.5
Sample taken from depth of 5 m bgl from a soil bore to be installed as Monitoring Well MW07, within work area MA	MA_MW07_5.0
Sediment samples taken from SS01 within work area MM at a depth of 0.25 m below the surface of the sediment.	MM_SS01_0.25
Surface water samples taken from SS01 within work area MG	MG_SS01

Sample jars were sealed and immediately placed in an insulated cooler, on ice, and stored to minimise potential loss or degradation of volatile compounds. Samples were shipped under chain of custody documentation to the analytical laboratory. Trip blanks and field blanks were used to assess if cross contamination occurred during the sample collection process.

Soil samples were collected for asbestos analysis in general accordance with the requirements of the *ASC NEPM* (NEPC, 2013) incorporating the WA DOH guidelines (*WA DOH, 2009*) and the *ERM Assessment of Asbestos Impacted Areas SOP* (ERM, 2012). No potential asbestos containing material (ACM) was identified at the surface or during the investigation works, and there were no ACM fragments submitted for analysis. Discrete 500 ml samples of soil were collected in snap lock bags during NDD for laboratory analysis for asbestos fibres. These samples were submitted to the laboratory for asbestos identification and (where identified) quantification (%w/w analysis) in accordance with the *ASC NEPM* (NEPC, 2013) and the WA DOH guidelines (*WA DOH, 2009*).

#### **4.3.2**      *Decontamination Procedure*

Down-hole drilling and non-single use sampling equipment was decontaminated by initially removing any residual soil with a stiff brush and then washing the equipment in a 2% Decon 90 solution and rinsing with potable water.

#### **4.3.3**      *Soil Bore Reinstatement*

Upon completion, soil bores were backfilled and the surface covering reinstated to match existing.

#### **4.3.4**      *Management of Waste Materials Generated During Drilling*

All non-liquid waste materials generated during drilling works were stored on-site in stockpiles inside a temporary bund in a designated area near the ash repository. If evidence of significant contamination was observed during drilling (e.g. staining or odour) potentially impacted wastes could be stored separately.

The soil will be beneficially re-used as capping material within the ash repository, in accordance with environmental licence conditions. The ash repository is currently managed by LendLease on behalf of Energy Australia.

Potentially contaminated PPE used during drilling including Tyvek suits and disposable P2 face masks were placed inside two 200 micrometre (µm) thick, asbestos labelled bags (i.e. double bagged) and then into labelled drums. The drums were collected by an appropriately licenced waste contractor (Environmental Treatment Services Pty Ltd - ETS) and transported to an appropriately licenced waste facility in accordance with NSW waste regulations. Relevant disposal documentation can be provided upon request.

#### 4.4 GROUNDWATER INVESTIGATION

##### 4.4.1 Monitoring Well Construction

Selected boreholes were converted to groundwater monitoring wells in accordance with ERMs SOPs. The groundwater monitoring well locations are presented in *Figures 5.1 to 5.7 of Annex A*. The following methodology was implemented to install new monitoring wells:

- wells were constructed of heavy duty 50 mm diameter class 18 uPVC with factory slotted screen (0.4 mm slots) and plain well casing. Where practicable, the wells were screened within groundwater bearing strata in accordance with ERMs SOPs with consideration of potential regional and seasonal fluctuations of the water table and constructed to allow the potential ingress of non-aqueous phase liquids (NAPL);
- following drilling, the well casing and screen were inserted into the drill casing. Washed and graded filter sand was poured into the annulus between the well screen and casing wall, ensuring that the sand covered the entire screened level and extended approximately 0.5 m above the top of the well screen;
- bentonite granules were then poured on top of the sand to an approximate thickness of 1 m and hydrated to effectively seal off the well from surface water or perched/shallow groundwater inflows; and
- the remaining annulus from the top of the seal to the base of the concrete was grouted with cement/bentonite grout to within 0.25 m of the surface and the final 0.25 m reinstated with concrete and a heavy duty well cover (flush gatic cover or raised monument as appropriate). The well casings were sealed with air-tight, lockable 'Envirocaps'.

Following monitoring well installation, each well was developed using a submersible 12V electric 'Typhoon' pump to remove any fine or granular materials or contaminants potentially introduced during drilling and to optimise hydraulic connectivity with the surrounding aquifer. Wells were considered developed when either a minimum of 10 well volumes had been removed, when water quality parameters had stabilised or if the well was developed dry prior to this.

Monitoring well construction details are presented within the borehole logs in *Annex D*.

#### 4.4.2 *Groundwater Purging and Sampling Protocol*

Groundwater purging and the sampling of newly installed monitoring wells generally occurred at least one week following monitoring well installation and development, to allow subsurface conditions to stabilise. Both new and existing monitoring wells were purged and sampled as outlined below.

The presence of odours was noted, where applicable, following removal of the well cap and prior to purging. Any odours were described by reference to their intensity and character.

Following a period of no pumping (as a minimum 24 hours), wells were dipped to gauge the depth to groundwater, and the potential presence and depths of NAPLs.

Monitoring wells were purged using either a thoroughly decontaminated peristaltic or micro purge pump under low flow conditions, where hydrogeological conditions allowed, until sufficient water has been removed to obtain stabilised readings of pH, conductivity, redox potential, temperature and dissolved oxygen which was calibrated prior to use. The stabilisation criteria are as described below.

**Table 4.2** *Water quality parameter stabilisation criteria*

<b>Parameter</b>	<b>Stabilisation criteria</b>
pH	± 0.1 pH units
Electric Conductivity (EC)	± 3% (µS/cm or mS/cm)
Temperature	± 0.5°C
Oxidation Reduction Potential (ORP)	± 10 mV
Dissolved Oxygen (DO)	± 0.3 mg/L

It is noted that both ORP and DO are typically slower to stabilise than the other parameters. Where ORP and DO did not stabilise, therefore, greater weight was given to pH and EC as the stabilising parameters.

Low-flow sampling techniques were used to obtain samples that were representative of the local groundwater environment at the Site. The inlet of the low-flow purge pump was placed approximately 50 cm from the base of the well in order to obtain a representative sample. Water samples were collected using equipment dedicated to each monitoring well to reduce the potential for cross-contamination between sampling locations.

The following order of sampling was adopted:

- samples to be analysed for volatile compounds placed into 40 mL amber vials;

- samples to be analysed for semi-volatile compounds placed into one 100 mL solvent washed amber bottles and one, 1 litre solvent washed amber bottle (for inter-laboratory duplicate samples);
- samples to be analysed for dissolved metals filtered through disposable 0.45 µm filters and placed in 60 mL plastic bottles preserved with nitric acid, or 60 mL unpreserved plastic bottles for ultra-trace metals;
- samples to be analysed for ferrous iron filtered through disposable 0.45 µm filters and placed in 60 mL plastic bottles preserved with hydrochloric acid; and
- samples to be analysed for major cations and anions placed in an unpreserved 250 mL plastic bottle.

Light Non-Aqueous Phase Liquid (LNAPL) was observed at three locations in area ME during the groundwater monitoring and sampling event. Where LNAPL was detected with an interface probe, a clear plastic bailer was used to confirm the presence, thickness and appearance of the LNAPL. No samples were collected or analysed from groundwater monitoring wells where LNAPL was detected.

The containers were filled, where practical, to minimise headspace, before being sealed and appropriately labelled. Labels included the following information:

- sample identification number;
- sampler;
- job number; and
- date of collection.

Samples were sealed and immediately placed in a cooler on ice to minimise potential for degradation of the sample. All samples were shipped under chain of custody documentation to the analytical laboratories.

#### **4.4.3 Waste Material Generated During Groundwater Development/Purging**

With approval from Delta Electricity and Energy Australia, waste water from development and purging of groundwater monitoring wells was disposed of via designated drains on-site which discharged to treatment systems.

#### 4.5 SURVEYING

All soil bore investigation locations were digitally located by field staff with a handheld Global Positioning System (GPS) unit. Additionally, all groundwater monitoring wells were surveyed by a registered surveyor (Craven Elliston & Hayes) to AHD for elevation and MGA coordinates for location. Survey data is presented in *Annex J*. The elevation of the highest point of the top of the uPVC well casing was surveyed to facilitate appropriate groundwater elevation calculations and groundwater flow direction interpretations.

#### 4.6 SEDIMENT INVESTIGATION

Sediment samples were collected from 7 sampling locations (as shown on *Figure 5.7, Annex A*).

Sediment samples were collected in general accordance with the methodologies outlined in *CSIRO Handbook for Sediment Quality Assessment* (2005). Sediment was collected from each sampling location with a stainless steel Van Veen grab sampler. The grab sample was inspected and if it was deemed to be of acceptable quality i.e. Van Veen fully closed, the sediment-water interface undisturbed with no evidence of loss of fines, and sufficient sample volume, the sediment was transferred to a container and homogenised.

If there was insufficient sample volume in a single grab sample, but the sample was otherwise of acceptable quality, sediment from multiple grabs was included in the sample.

Sample handling and labelling procedures were consistent with those adopted for soil sampling and those outlined in *Handbook for Sediment Quality Assessment* (CSIRO, 2005). The sediment volume, colour, grain size, odour, and presence of debris, organic matter, or biota were noted. Sediment samples were transferred to laboratory supplied glass jars for chemical analysis and 500 mL 'snaplock' bags for grain size analysis. Care was taken to minimise head space in the sample jars to reduce the potential for loss of volatile COPCs. The samples were stored on ice and transported under chain of custody to the analytical laboratory. The Van Veen and all other equipment used in the process of collecting the sediment samples were decontaminated (using the same procedures as those previously outlined for soil sampling equipment) between sampling locations.

#### 4.7 SURFACE WATER INVESTIGATION

Surface water sample locations were co-located with sediment sample locations. Surface water samples were collected prior to the collection of sediment samples, to avoid increased turbidity which may occur following sediment sampling.

Surface water samples were collected from Lake Lyell and Thompsons Creek Reservoir. Surface water samples were collected approximately 1.0 m above the sediment using a 1 litre Van Dorn sampler. The water was transferred directly from the Van Dorn sampler to analyte-specific laboratory supplied containers.

Sample containers were sealed and immediately placed in a cooler on ice to reduce potential for degradation of COPCs. The samples were then transported under chain of custody conditions to the analytical laboratory, and analysed for relevant COPCs.

A calibrated water quality meter was used to measure field parameters including pH, conductivity, redox potential, temperature, total dissolved solids (TDS), and dissolved oxygen. Observations of the general condition of the surface water and its surrounds were recorded during sampling.

#### 4.8 LABORATORY ANALYSIS

The laboratories used for the investigations were accredited by the National Association of Testing Authorities (NATA), Australia. The primary laboratory used for soil and groundwater analysis was ALS Environmental Pty Ltd (ALS). Inter-laboratory duplicate samples were analysed by a secondary laboratory, Envirolab Services Pty Ltd (Envirolab). The analytical methods used by each laboratory are provided in the laboratory certificates in *Annex H*.

Soil, sediment, groundwater and surface water samples were analysed for the following COPCs:

- metals and metalloids (arsenic, cadmium, chromium, copper, nickel, lead, mercury, selenium and zinc);
- total recoverable hydrocarbons (TRH);
- polycyclic aromatic hydrocarbons (PAHs); and
- benzene, toluene, ethylbenzene and xylenes (BTEX);

Additional contaminants of concern were analysed on a sub-section of the soil and groundwater samples collected. These contaminants included:

- asbestos (presence / absence – soil only);
- polychlorinated biphenyls (PCBs) – related to use of PCB-containing transformer oils on site; and
- volatile organic compounds (VOCs in addition to BTEX).

Selected soil samples were also analysed for the following to allow for adoption of appropriate screening values:

- total organic carbon (TOC);
- particle size distribution (PSD);
- electrical conductivity (EC); and
- pH and cation exchange capacity (CEC).

#### 4.9 *QUALITY ASSURANCE/QUALITY CONTROL*

A detailed QA/QC report including field procedures, laboratory methods and an analysis of QA/QC results from the investigation is provided in *Annex F*. QA/QC information incorporating inter-laboratory and intra-laboratory duplicates, rinsate samples and trip spike/blank samples is also presented in *Tables F6 to F13 of Annex F*.

In summary, the QA/QC data reported by ALS for soil and groundwater samples and field duplicate results were generally free of systematic and method biases and were assessed to be of sufficient quality for the purposes of this investigation.

There were some instances where the adopted screening values were less than the laboratory LOR. These potential non-conformances are discussed in *Section 5.6* of this report.

5 **RESULTS AND DISCUSSION**

5.1 **SITE GEOLOGY OBSERVATIONS**

A generalised description of the lithology and geology encountered at the Site is presented in *Table 5.1*. Detailed descriptions of the Site lithology and geology as observed during the investigation are presented on the borehole logs in *Annex D*.

Backfilled former open-cut mine voids were present across the current operational areas of the Site. These appeared to have been backfilled with overburden at the end of mining operations. Within these disturbed portions of the Site, subsurface soil conditions encountered largely comprised fill materials in the form of reworked local soils and rock overlying natural bedrock. An example of mine overburden fill materials is shown in *Photograph 20, Annex G*. Within undisturbed areas, fill typically overlaid shallow natural bedrock generally within 1.5 m of the surface. The depth to bedrock varied across the Site corresponding with topography, with outcropping siltstone and sandstone observed in elevated areas to the west of the operational area. An outcrop of coal is shown in *Photograph 14, Annex G* and an outcrop of siltstone is shown in *Photograph 15, Annex G*.

**Table 5.1 Generalised Field Lithology Descriptions**

<b>Lithological Unit</b>	<b>Description</b>	<b>Depth<sup>1</sup> (m bgl)</b>
<i>Hardstanding</i>	Concrete generally in good condition. (present in locations within the operational area)	0 - 0.2
<i>Fill - Mine Overburden</i>	Sandy clay or gravelly clay with angular gravels, cobbles and boulders, brown or brown with orange, red and grey mottling, dry to moist, non-plastic, no odours or staining.	0.2 - up to 15 <sup>2</sup>
<i>Natural Soil<sup>3</sup></i>		
Clay	Dark brown, becoming pale grey with orange mottling with depth, moist to wet, homogenous, high plasticity, organic matter (fibrous roots).	2.5 - bedrock
Clay	Yellow brown, becoming pale grey with depth, moist, homogenous, high plasticity, organic matter	2.5 - bedrock
Sandy Clay	Brown, wet, low plasticity	4.1- 5.0 (AEC MA)
Silt	Grey brown, slightly moist, homogenous, low plasticity, no staining, no odour, organic matter.	4.5-5. (AEC MB)

Lithological Unit	Description	Depth <sup>1</sup> (m bgl)
<i>Bedrock</i>	Interbedded siltstone, sandstone, shale and coal. Siltstone: pale to dark grey, generally dry  Sandstone: pale grey to brown, medium to coarse grained, dry, at times - moist to wet;  Shale: dark grey, very fine grained, generally dry;  Coal: black, dry or wet.	1.5 – 30.0
<ol style="list-style-type: none"> <li>1. Given the variation in topography and mining activities across the Site, depths and lithologies may vary across the site.</li> <li>2. Depth of fill across the site varied significantly. Fill material was recorded up to 15 m bgl within former open cut mining areas and extending to 1.5 m within areas undisturbed by mining activities (generally the western portion of the main operational area (AEC MK) )</li> <li>3. Natural soils typically recorded in the buffer lands and around the former landfill area (AEC MA), coal storage area (AEC MB), and some portions of operational area (AEC MK)</li> </ol>		

## 5.2 GROUNDWATER FIELD OBSERVATIONS

Newly installed monitoring wells were generally gauged and sampled at least 72 hours after well installation and development to allow subsurface conditions to stabilise. Groundwater gauging and sampling was completed for newly installed and existing monitoring wells between 3 October and 19 December 2013. During this time, a total of 90 mm of rain was recorded. Rain was largely recorded (31.6 mm) between 11 and 23 November, 2013.

Groundwater gauging data is presented in *Table 2 of Annex B*. Groundwater was encountered at depths ranging from 0.60 m bgl to 29.01 m bgl, or 904 m AHD to 970 m AHD.

Field records for groundwater well development and sampling area presented *Annex E*. Groundwater field parameters recorded during purging of wells prior to sampling are presented in *Table 3 of Annex B*.

## 5.3 SEDIMENT AND SURFACE WATER SAMPLES

A total of 7 sediment and surface water samples were collected to assess the baseline condition of Lake Lyell and Thompsons Creek Reservoir. One additional surface water sample was collected from the freshwater pond in AEC MH. Sampling locations were distributed around the AEC as presented in *Figures 5.7 of Annex A*. Further details of these works are presented in *Section 0* and *Section 5.4.8*.

## 5.4 AREAS OF ENVIRONMENTAL CONCERN (AEC) SUMMARY

### 5.4.1 MA -Former Landfills

#### *Background*

There are three closed landfills present on the Site, as shown in *Figure 5.1, Annex A*, which date from the early years of construction and operation of Mt Piper Power Station.

Whilst each landfill was intended for a specific purpose and such practices were not uncommon at that time, the disposal of waste was largely uncontrolled and a range of potential contaminants may therefore be present. The former construction waste landfill was used by contractors for disposal of building waste and materials from the construction of Mt Piper Power Station. The landfill is located in a gully in the western buffer land. Potential contamination concerns include impact from non-inert construction wastes (oils, solvents, paints). The former general waste landfill included putrescible waste and site management indicated that it was not used for disposal of restricted wastes (ash or related wastes). The landfill consisted of an unlined trench without controls on landfill gas or leachate. The landfill was reportedly used between 1993 and 1995, when the Power Station changed its policy and disposed of waste off-site. A relatively small proportion of the planned landfill was therefore filled. The landfill is located to the south-west of the main operational area in the western buffer land. Potential contamination concerns include impact from putrescible wastes (leachate). The 'chitter dam' landfill is located upgradient from the former putrescible waste dump and was constructed originally as a surface water dam but was never used for storage of water supplies. The dam was converted for use as a landfill for chitter, which is a coarse reject material from coal washing (PPK Environment & Infrastructure Pty Ltd, 2000) 'Hard' construction waste such as concrete was also disposed in this landfill (PPK Environment & Infrastructure Pty Ltd, 2000). Potential contamination concerns include impact from chitter (that is, coarse carbonaceous wastes) such as acidity, dissolved salts and heavy metals.

Given the absence of previous environmental characterisation work, further investigation was considered to be required to provide a baseline assessment of soil and groundwater conditions in this area.

#### *AEC Methodology and Investigation Field Observations*

A total of six soil investigation bores, three of which were completed as groundwater monitoring wells, were advanced within this AEC. One monitoring well was installed down- or cross- hydraulic gradient of each of the chitter dam, general and construction waste landfills. Three existing monitoring wells were also gauged and sampled as part of the ESA. The sampling locations within this AEC are presented on *Figure 5.1 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 1.8 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

A summary of the field observations from the drilling works are presented within *Table 5.2*.

**Table 5.2** *Field Observations Summary - AEC MA*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm v - isobutylene equivalents)
MA_MW01	4.3	None	0- 0.1
MA_MW03	3	None	0-0.1
MA_MW05	0.3	None	n/a <sup>^</sup>
MA_MW07	8.2	None	0.0
MA_MW08	0.8	None	n/a <sup>^</sup>
MA_MW12	5	None	0.0-1.8

<sup>^</sup> refusal encountered on sandstone. Insufficient sample for duplicate to measure with PID due to coarse fill material (gravel).

Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity (EC) readings indicated fresh water conditions. EC readings in the southern part of the Site, both up-gradient of the chitter dam (2.6 µS/cm at MA\_MW01) and down-gradient of the former general waste landfill (0.2 µS/cm at MA\_MW07 and ML\_MW12) were an order of magnitude lower than the typical EC readings across the Site (median EC 665 µS/cm).

No indications of contamination such as sheens or odours were observed during groundwater sampling within this AEC. As summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

*Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4a of Annex B*

Measured concentrations of COPCs were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR with the exception of various heavy metals, however all of these concentrations were below the adopted screening values.

*Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5a of Annex B*. In addition to monitoring wells located within the designated AEC, monitoring well ML\_MW10 is located upgradient of the former construction landfill and has been considered as part of this assessment. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC.

Copper, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from monitoring wells within this AEC. At ML\_MW10 the measured concentration of lead also exceeded the adopted ecological screening values.

Manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values in groundwater samples collected from monitoring wells within this AEC. Manganese was detected in groundwater in excess of the human health (recreational assessment) criteria in three groundwater monitoring wells.

*Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

All groundwater monitoring wells in this AEC, including upgradient well ML\_MW10, reported metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included copper, lead, manganese, nickel and zinc. Manganese and nickel concentrations in excess of the adopted human health (drinking water and/or recreational) screening values were also reported in a number of samples.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

**5.4.2*****MB - Coal Storage Area****Background*

The coal storage area is approximately 16 ha in area and is used for the stockpiling of coal prior to transfer via conveyor to the mill and crusher and then to the boilers. Potential contamination sources or activities include coal stockpiling, use and maintenance of conveyors, coal truck washdown bays

and associated settling ponds, and seepage from contaminated stormwater settling ponds. Refuelling of mobile plant is discussed in *Section 5.4.5*.

It is recognised that the coal conveyor system and associated sediment ponds may represent an AEC (related to mechanical operations (oils) and coal fines that may migrate to Neubecks Creek), however these have not been considered to warrant targeted environmental investigation.

It was considered unlikely that coal storage would represent a significant contamination issue in the context of the site-wide assessment; however, given the absence of previous environmental characterisation work, further investigation was considered to be required to provide a baseline assessment of soil and groundwater conditions in this area.

*AEC Investigation Methodology and Field Observations*

A total of five soil investigation bores, all of which were completed as groundwater monitoring wells, were installed within this AEC. Soil bores and monitoring wells were distributed around the perimeter of the AEC as presented in *Figure 5.2 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation, were noted within this AEC. No staining or unusual odours were detected through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis did not exceed 2.1 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

Field observations during the drilling works are summarised in *Table 5.7*.

**Table 5.3**      *Field Observations Summary - AEC MB*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MB_MW01	1.1	None	0
MB_MW02	13.8	None	0-2.1
MB_MW03	8	None	0-0.2
MB_MW04	8.2	None	0
MB_MW05	8	None	0-0.3

Groundwater field parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC.

*Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4.b, Annex B*.

Measured concentrations of COPCs were below the adopted screening values in the soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC; however all concentrations were below the adopted screening values.

Asbestos was not detected in soils sampled within this AEC.

*Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.b of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Annex A*.

Measured concentrations of the majority of COPCs were below the laboratory LOR in all groundwater samples collected from within this AEC. The exceptions to this were detections of some metals within groundwater across this AEC.

Manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from the wells within this AEC. The ecological screening values for groundwater were also exceeded for copper at MB\_MW02, and cadmium and lead at MB\_MW04.

Manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values in groundwater samples collected from monitoring wells within this AEC.

*Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

Samples collected from all monitoring wells within this AEC were reported with metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included cadmium, copper, lead, manganese, nickel and zinc. Concentrations of manganese and nickel in excess of the adopted human health (drinking water) screening values were also detected in a number of samples.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

**5.4.3 MC - Electrical Transformers**

*Background*

Transformers and associated oil storage tanks are located on concrete within a contained area. In general, transformers are considered to be “PCB free”, with transformers tested regularly to assess PCB concentrations. There was a marginal exceedence of the statutory limit under the Environmentally Hazardous Chemicals Act 1985 for the notification of PCBs (Unit 2B 11/3.3kV Auxiliary Transformer) of 2 ppm (mg/kg) with 3.1 ppm (mg/kg). Delta did not report any spills within the transformer area and given the general level of housekeeping and monitoring, it is considered unlikely that a release of significant quantity has occurred and not been reported.

This area was considered to represent a relatively low risk in the context of this assessment, given the absence of any known historical release and the low likelihood of a pathway to soil and groundwater. However, in the absence of previous environmental characterisation work, further investigation was considered to be required to provide a baseline of soil and groundwater conditions in this area.

*AEC Investigation Methodology and Field Observations*

A total of four soil investigation bores, all of which were completed as groundwater monitoring wells, were installed within this AEC. Soil bores and monitoring wells were distributed around the perimeter of the AEC as presented in *Figure 5.3 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation, were noted within this AEC. No staining or unusual odours were detected through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis did not exceed 1.1 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

Field observations during the drilling works are summarised in *Table 5.7*.

**Table 5.4 Field Observations Summary – AEC MC**

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MC_MW01	5.5	None	0.4- 2.0
MC_MW02	5	None	0.2-1.4
MC_MW03	5	None	0.1-0.6
MC_MW04	6.2	None	0.5-1.4

Groundwater field parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4.c of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in the soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR. TRH fractions were detected in soil collected from MC\_MW04 at a depth of 0.15 m bgl. These concentrations did not exceed adopted screening values.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC; however all concentrations were below the adopted screening values.

Asbestos was not detected in soils sampled from within this AEC.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.c, Annex B*. Exceedences of the adopted screening values are also graphically presented in *Annex A*.

Measured concentrations of the majority of COPCs were below the laboratory LOR in all groundwater samples collected from within this AEC. The exceptions to this were detections of some metals within groundwater across this AEC.

Manganese, nickel, zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from the wells within this AEC. The ecological screening values for groundwater were also exceeded for copper and lead at MC\_MW02 and ML\_MW12, and arsenic and cadmium at MC\_MW04 and ML\_MW15. The concentration of arsenic reported at MC\_MW04 exceeded human health (drinking water and recreational) screening values. The concentration of arsenic at ML\_MW15 exceeded the human health (drinking water) screening values.

Manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values in groundwater samples collected from monitoring wells within this AEC. Manganese was detected in groundwater at concentrations in excess of the human health (recreational) screening values at MC\_MW03.

#### *Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

Samples collected from all monitoring wells within this AEC were reported with metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, cadmium, copper, lead, manganese, nickel, zinc. Concentrations of arsenic, lead, manganese and nickel in excess of the adopted human health (drinking water) screening values were also detected in a number of samples. Concentrations of arsenic in excess of human health (recreational) screening values were detected in one sample collected from MC\_MW04.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

#### **5.4.4**

#### ***MD - Workshops***

##### *Background*

Maintenance workshops are located within the main operational areas of the Site at:

- the western side of the main plant, behind Unit 2 (AEC MK);
- the south-east corner of the coal handling area (this is a combined workshop and mobile plant refuelling area (AEC ME)); and
- bulk chemical storage is located adjacent to the stores building (AEC MJ).

As the workshops are located within the main operational areas of the Site, potential contamination issues have been addressed in other AECs, including MK (Operational Areas), ME (Mobile Plant Refuelling Area) and MJ (Operational USTs) which are located adjacent to the stores building. Monitoring wells and soil bores in these areas are discussed in the relevant sections.

Site management indicated that the workshops have remained in the same location since plant operation commenced. Delta management reported that some chlorinated hydrocarbons such as “Dev-Tap” (1,1,1, Trichloroethane) have been used historically, but that such products are no longer used. A separate known issue relating to fuel storage is discussed in *Section 5.4.5*. Previous soil and groundwater investigations have been conducted around the underground fuel infrastructure, and did not include laboratory analysis of soils (as discussed in *Section 5.4.10*). Therefore further investigation was considered to be required to provide a baseline for soil and groundwater conditions in this area.

*AEC Methodology and Investigation Field Observations*

A total of four soil investigation bores, three of which were completed as groundwater monitoring wells, were installed within this AEC to assess potential impacts to soil and groundwater. In addition, soil bores and monitoring wells installed in AEC ME (Mobile Refuelling Plant) and MK (Operational Areas), and existing wells in AEC MJ (Operational USTs) also target the workshop areas. Sampling locations were distributed around the AEC as presented in *Figure 5.3 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis typically did not to exceed 1.8 ppm v (isobutylene equivalent), with the exception of one sample from MD\_MW04 which reported a concentration of 81.7 ppm v (isobutylene equivalent).

A summary of the field observations from the drilling works are presented within *Table 5.5*.

**Table 5.5** *Field Observations Summary - AEC MD*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MD_MW01	7	None	0- 0.6
MD_MW02*	1.8	None	1.6-1.8
MD_MW03	4	None	0.8-1.7
MD_MW04	6	Hydrocarbon odour	1.1-81.7

Notes: \* soil bore only as monitoring well could not be installed due to refusal at shallow depth and proximity to sub-surface utilities.

Groundwater samples were collected from the three monitoring wells located within this AEC. Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

A light oily sheen was observed during groundwater purging at MD\_MW04. No indications of contamination, such as sheen or odours, were observed during groundwater sampling at MD\_MW02 and MD\_MW03. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4d of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of all COPCs with the exception of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> (discussed below) were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR.

Concentrations of some TRH fractions were reported above the corresponding laboratory LOR in soil collected from 1.2 m bgl at MD\_MW04. All concentrations were below the adopted screening values with the exception of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> which exceeded the adopted ESLs. Concentrations of various heavy metals were above the corresponding laboratory LORs in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values.

Asbestos was not detected in soils sampled from within this AEC.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.d of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC.

Manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from all groundwater monitoring wells within this AEC. The ecological screening values for groundwater were also exceeded for arsenic at MD\_MW04, cadmium at MK\_MW01, chromium at MD\_MW03, copper at MK\_MW08 and lead at MD\_MW03 and MK\_MW08.

Manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values in groundwater samples collected from monitoring wells within this AEC.

The concentration of lead reported at MD\_MW03 exceeded human health (drinking water) screening values.

#### *Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC with the exception of concentrations of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> in soil collected from 1.2 m bgl at MD\_MW04 which exceeded the adopted ESLs. The hydrocarbon impacts identified at this location may be related to historical leaks or spills associated with workshop activities in this area. Area MD is largely covered in concrete hardstanding, with some grass areas around service easements. Area MD is not considered to have any significant ecological value and thus the application of the ESLs is considered to be overly conservative in this instance.

Samples collected from all monitoring wells within this AEC were reported with metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, cadmium, chromium, copper, lead, manganese, nickel, zinc. Concentrations of manganese and nickel in excess of the adopted human health (drinking water) screening values were also detected in a number of samples. Concentrations of lead in excess of human health (drinking water) screening values were detected in one sample collected from MD\_MW03. As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

### **5.4.5 ME - Mobile Plant Refuelling Area**

#### *Background*

The mobile plant refuelling area is located adjacent to the coal storage area and is used by large mobile plant. The infrastructure consists of a shed, small workshop and a wash bay, with a diesel UST and bowser located on the southern side of the wash bay. A washdown pit and a "bobcat pit" are located adjacent to the day maintenance workshop and the integrity of this in-ground pit is unknown. The wash bay drains to an oil-water separator located on the northern side of the wash bay. The oil-water separator drains through an underground pipe in a north-easterly direction, discharging into an open surface water drain along the coal storage area boundary. The bobcat pit drains to an oil collection pit which is pumped out by a road tanker. Although a covered concrete platform is provided at the mobile plant yard, the ground immediately surrounding the mobile plant area is unsealed and there was staining observed on bare ground beneath the large mobile plant.

Light non-aqueous phase liquid (LNAPL) has been previously identified in a groundwater monitoring well (MWMP8) on the northern side of the wash bay, adjacent to the oil-water separator in October 2012 (SMEC, 2012). Further investigations were undertaken, including integrity testing and excavation to inspect the UST and lines, which indicated no issues with the UST. Hydrocarbon fingerprint analysis was undertaken on samples of the diesel from the UST and the LNAPL in March 2013. The LNAPL was weathered with an age estimate of 25 years and was hence considered to be unrelated to the diesel currently in the UST. Other potential sources of historical petroleum releases include an aboveground release (spill from tanker or unknown AST), linework failure, or potentially unknown USTs.

The PESA (ERM, 2013b) considered further investigation was warranted to assess the potential for soil and ground contamination.

#### *AEC Methodology and Investigation Field Observations*

Proposed investigation locations in this AEC, as stated in the SAQP (ERM, 2013a), included four soil investigation bores, all of which were proposed to be completed as groundwater monitoring wells. Sub-surface clearance was undertaken at the four proposed monitoring well locations, and NDD was completed on 14 November to a depth of 1.5 m bgl in preparation for drilling to the target depth, estimated at 6 m bgl. Drilling of these four locations was scheduled for 18 November 2013. On arrival at Site on 18 November a drill rig under the direction of another consultant, SMEC, had begun drilling of monitoring wells in this area under directions from Energy Australia. ERM therefore ceased work in this AEC until the SMEC investigation was completed.

SMEC installed five groundwater monitoring wells in this AEC on 18 and 19 November 2013, including four monitoring wells and one recovery well (SMEC, 2014). The findings of the SMEC investigation are reported in the report *Installation and Monitoring of Plume Delineation Groundwater Wells - Bulldozer Workshop - Mt Piper Power Station* (SMEC, 2014). The stated objectives of the SMEC investigation were to delineate the extent of the previously identified hydrocarbon plume, install a product recovery well within the area of the identified plume and advise Energy Australia of likely remedial actions and steps/obligations in relation to the identified hydrocarbon contamination (SMEC, 2014).

The scope of works completed by ERM in this AEC was modified following the completion of the five additional groundwater wells by SMEC described above. Of the proposed ERM soil investigation bores, three locations were abandoned following NDD, and one location (inferred up-gradient of the identified LNAPL plume) was completed as a groundwater monitoring well (ME\_MW04). The three soil investigation bores (ME\_SB01, ME\_SB02 and ME\_SB03) were completed to a depth of 1.5 m bgl and soil samples were analysed for the COPCs.

The scope of works for this AEC completed by ERM as part of this Phase 2 ESA included four soil investigation bores, one of which was completed as a groundwater monitoring well. Soil samples were collected from the four ERM soil bore locations (ME\_SB01, ME\_SB02, ME\_SB03 and ME\_MW04). The depth to groundwater was gauged at all nine groundwater wells, including the recovery well, and LNAPL was detected in four locations. For clarity, a summary of monitoring well installations in this AEC is provided in *Table 5.6* below.

**Table 5.6** *Summary of Wells in AEC ME*

Borehole ID	Alternate Name	Well Depth (m bgl)	Location Relative to Source
ME_X_MW01	MWMP09#1	6	Up-gradient, to west of workshop.
ME_X_MW02	MWMP10#1	7.5	Cross-gradient of ME_X_MWMP8*
ME_X_MW03*	MWMP12#1	7.5	Down-gradient of ME_X_MWMP8*
ME_X_MW05	MWMP11#1	6	Cross-gradient of ME_X_MWMP8*
ME_X_MW06	MWMP14#1	6	Down-gradient of ME_X_MWMP8*
(Recovery Well)	MWMP13#1		Adjacent to ME_X_MWMP8*
ME_X_MWMP7*	MWMP07#2	6	Adjacent to UST & bowser
ME_X_MWMP8*	MWMP08#2	4	Adjacent to oil-water interceptor
ME_MW04	ERM1#3	7.8	Up-gradient of UST & bowser

1. Well installed by SMEC (Dec 2011); note the recovery well was not sampled by ERM.  
 2. Well installed by SMEC (Nov 2013)  
 3. Well installed by ERM (Nov 2013). SMEC (2014) used alternate name "ERM1".  
 \* well detected LNAPL  
 ^LNAPL detected during gauging in November 2013, prior to drilling works.

Monitoring wells were distributed with one up, one across and two on the down hydraulic gradient side of the existing groundwater monitoring well ME\_X\_MWMP8 where LNAPL had historically been reported. The sampling locations (both those installed by ERM and those installed by others) within this AEC are presented on *Figure 5.3* of *Annex A*. Relevant borehole logs are presented within *Annex D*.

It was observed that the ground surface within this AEC was unsealed, with coal present at the surface, and staining evident on the ground surface.

During drilling by ERM no staining or unusual odours were detected at depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 0.7 ppm v (isobutylene equivalent) in any soil sample collected from this AEC. Borelogs from the investigation completed by SMEC (2014) indicate hydrocarbon odours and LNAPL sheen at 5 m bgl at MWMP10 and a hydrocarbon odour at MWMP12

A summary of the field observations from the drilling works by ERM are presented within *Table 5.7*.

**Table 5.7** *Field Observations Summary - AEC ME - Soil*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
ME_SB01	1.5	None	0.1-0.2
ME_SB02	1.5	None	0-0.3
ME_SB03	1.5	None	0.3-0.6
ME_MW04	12.5	None	0.3-0.7

Groundwater samples were collected from the five monitoring wells located within this AEC, with no samples collected from three monitoring wells where LNAPL was detected, and no sample was collected from the recovery well. Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

LNAPL was detected during groundwater gauging in three groundwater monitoring wells within this AEC, as summarised in *Table 5.8* below. The presence of LNAPL was visually confirmed with a clear plastic bailer. No other indications of contamination, such as sheens or odours were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

**Table 5.8** *Field Observations Summary - AEC ME - Groundwater*

Borehole ID	LNAPL thickness (mm)	Depth to LNAPL (m bgl)
ME_X_MWMP7	2	5.377
ME_X_MWMP8	200	3.425
ME_X_MW03	5	5.154

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4e of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values.

Asbestos was not detected in soils sampled within this AEC.

*Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.e of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

LNAPL was detected in three groundwater monitoring wells within this AEC. Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC.

Manganese, nickel and zinc exceeded the adopted ecological screening values in groundwater samples collected from all groundwater monitoring wells within this AEC. At monitoring well ME\_MW04 the measured concentration of copper also exceeded the adopted ecological screening values. Manganese exceeded the adopted human health screening values (drinking water and recreational) in groundwater samples collected from all groundwater monitoring wells within this AEC. Nickel exceeded the adopted human health screening values (drinking water) in groundwater samples collected from all groundwater monitoring wells within this AEC, and also exceeded the human health screening values (recreational) at ME\_MW04.

*Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC. However, LNAPL was detected in three groundwater monitoring wells. Further discussion on the issue of LNAPL in this AEC is provided in *Section 5.6.2*.

Samples collected from all monitoring wells within this AEC were reported with metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included copper, manganese, nickel, zinc. Concentrations of manganese and nickel in excess of the adopted human health (drinking water and recreational) screening values were also detected in a number of samples.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

**5.4.6*****MF - Operational ASTs****Background*

Operational above-ground storage tanks at the Site include a 28 000 L diesel AST located near the ash repository; sulfuric, caustic and alum tanks at the demineralisation plant; and a refined recycled oil (RRO) installation on the south east corner of the operational area.

The demineralisation plant was assessed as part of the operational area (Area MK, see *Section 5.4.11*).

The fuel (RRO) installation investigated as part of this assessment was installed in 1990/91 and consists of two bunded 1.2 ML steel tanks, an unloading station for unloading two road tankers simultaneously and a small 36 kL overflow tank (Worley Parsons 2013). The ASTs are filled by road tankers, with gravity pipes (in concrete lined trenches) transporting fuel to dedicated duty and standby ignition oil pumps for each boiler (Worley Parsons 2013). There were no reported leaks or spills associated with the RRO. Potentially significant releases of fuel associated with the ASTs and/or pipework would likely be accounted for in the fuel reconciliations. Fuel is metered when delivered and when used, and the tanks are gauged periodically (Worley Parsons 2013). Fuel reconciliations are undertaken to account for any potential loss of fuel. Tank integrity tests are reported to be undertaken across the site on a routine basis. Documentation relating to the tank integrity testing and fuel reconciliations was not available at the time of the PESA, however was reported by Worley Parsons (2013).

It is considered unlikely that there have been potentially significant releases from the ASTs given that they are located within a concrete lined bunded area and any potential leaks or spills would be immediately evident, and would be contained within the bunded area. The potential for unknown leaks from the fuel oil pipeline is unlikely given that it is located within a concrete lined trench, which can be access via ground level covers for inspection and any potential leaks or spills would be evident from staining on the concrete.

A water retention pond is located approximately 60 m to the north and down-slope of the RRO ASTs. The pond receives discharge from an oil water interceptor which appears to collect water from inside the bund of the AST. The side walls of the pond were heavily stained black and the pond did not appear to be lined. A sheen was noted on the water in the pond. Maintenance works were carried out during the site investigation works, which involved pumping of water into a waste water truck.

Given the absence of previous environmental investigations the PESA concluded that further investigation was warranted to assess potential soil and groundwater contamination issues associated with the fuel (RRO) installation in this AEC.

#### *Methodology and Investigation Field Observations*

A total of five soil investigation bores were drilled and converted to monitoring wells within this AEC. One monitoring well was installed upgradient, and two downgradient of the RRO tank farm. Two additional monitoring wells were installed down-gradient of the water retention pond near the RRO.

A groundwater sample was collected from an existing monitoring well, MG\_X\_MP1, located near the diesel AST near the ash repository. No leaks or spills have been reported in this area, and the potential for unknown leaks from infrastructure is unlikely given that the infrastructure is above-ground, therefore no further investigations were targeted at this area.

The sampling locations within this AEC are presented on Figures 5.4 and 5.5 of Annex A. Relevant borehole logs are presented within Annex D.

With the exception of the observations of the water retention pond described above, no field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. Soil sampling was limited to less than 0.45 m bgl, with shale bedrock encountered in all locations at depths between 0.2 and 0.45 m bgl. No staining or unusual odours were detected at any depth through the sampled soil and rock profile. Measured concentrations of ionisable volatile compounds via headspace analysis sampled from surface soils did not exceed 0.2 ppm v (isobutylene equivalent).

A summary of the field observations from the drilling works are presented in *Table 5.9*.

**Table 5.9** *Field Observations Summary – AEC MF*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID (ppm v - isobutylene equivalents)
MF_MW01	16	None	0.2
MF_MW02	25	None	0.0
MF_MW03	13	None	0.0
MF_MW04	15.8	None	0.0
MF_MW05	27	None	0.0

Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. No evidence of contamination was reported during groundwater sampling.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4.f of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 7 of Annex A*.

Measured concentrations of all COPCs were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR. Concentrations of TRH C<sub>16</sub>-C<sub>34</sub> and total PAHs were above the corresponding laboratory LORs in soil samples at 0.2 m bgl from MF\_MW03 and total PAHs at 0.2 m bgl from MF\_MW05 however all concentrations were below the adopted screening values.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values. Asbestos was not detected in soils sampled within this AEC.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.f of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC.

Copper, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from all groundwater monitoring wells within this AEC. Lead was detected at concentrations in excess of the adopted ecological screening values in groundwater sampled from MF\_MW03. Cadmium was detected at concentrations in excess of the adopted ecological and human health (drinking water) screening values in groundwater sampled from MG\_X\_MP1. Nickel and manganese also exceeded the human health (drinking water) screening values in all sampled groundwater monitoring wells in this AEC.

#### *Discussion*

No exceedences of the adopted human health or ecological screening values were identified in soil samples collected from within this AEC.

Groundwater flow direction is variable within this AEC and appears to flow in a south-west and north-easterly direction. Based on the geology and water strike observed during well installation, a fault is inferred to run north-south through the centre of the AST farm which appears to influence groundwater flow. Groundwater is inferred to be present between 11 and 25 m bgl, under semi-confined conditions within coarse sandstone and a coal seam.

All six of the groundwater monitoring wells sampled reported metals concentrations greater than the adopted human health and ecological screening values. Metals exceeding the adopted ecological screening values included copper, lead, manganese, nickel and zinc. Manganese and nickel concentrations in excess of the adopted human health (drinking water) screening values were also reported in a number of samples. Elevated heavy metal concentrations in groundwater sampled from upgradient well MF\_MW03 correlate with slightly acidic pH in this location.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*. The groundwater results do not indicate significant hydrocarbon impacts in groundwater relating to the fuel infrastructure in this AEC.

#### 5.4.7 *MG - Current Ash Repository*

##### *Background*

The current ash repository is located directly to the north east of the Power Station, in the former Western Main open-cut mine void. The AEC MG refers to the ash repository currently in operation, as the recent extension to Lamberts North was completed in mid-2013, however was not yet in active operation at the time of completion of the investigation works described herein. The Lamberts North Ash Repository is discussed separately in *Section 5.4.8*.

The current ash repository covers an area of approximately 40 ha and has been operational since the first power generating unit came on-line at Mount Piper Power Station in 1993. The ash repository was designed for dry ash placement, with water addition being limited to water added for ash conditioning prior to disposal and dust suppression following disposal.

Brine conditioned ash is currently disposed in a designated area of the ash repository as permitted by the EPL (GHD, 2012). Seepage from the ash repository has the potential to be saline and contain heavy metals, and routine groundwater monitoring in compliance with the EPL is undertaken in accordance with the *Mt Piper Power Station Brine Conditioned Flyash Co-placement Extension Water Management and Monitoring Plan (WMP)* (Connell Wagner, 2008). The amended WMP, including the extension to Lamberts North, was approved by the NSW Department of Planning, with comments provided by NSW Office of Water and NSW EPA. The WMP includes guidelines for the receiving waters of Huons Pond and Neubecks Creek, and also locally derived ANZECC guideline trigger concentrations for groundwater. These guidelines and receiving water sites have been used for assessment of the Stage I and II brine placements since brine conditioned ash placement began at the Mt Piper Stage I site in 2000.

Recent earthworks have diverted surface water drainage away from the former Huons Gully which was located on the boundary between the existing ash repository and the extension in Lamberts North. Until 2013, surface water drainage along Huons Gully discharged into the Huon Pond (formerly known as the Groundwater Collection Basin), which was also reportedly in contact with groundwater at the base of the former Lamberts Gully Mine. Huon Pond subsequently discharged to Neubecks Creek.

The Huon Pond was filled as part of construction of the Lamberts North Ash Repository in 2013, and ERM understands that surface water drainage does not currently discharge directly to Neubecks Creek from the ash repository.

Annual groundwater monitoring is routinely undertaken at the repository for a range of potential constituents of concern including salinity, pH, heavy metals and chloride (used as tracer for brine mobilisation) (Aurecon, 2012). In previous investigations, elevated boron and sulfate concentrations have been attributed to historical coal mining operations, and a marked increase in chloride concentrations in monitoring bore MPM4/D10 was considered to be caused by seepage from the coal washery rejects ponds (Aurecon, 2012). A groundwater quality review undertaken in 2011 further found that surface and groundwater quality guidelines (as defined in the Water Management and Monitoring Plan (Connell Wagner, 2008) in the receiving waters of the Neubecks Creek and Huon Pond continued to be met.

While considerable environmental assessment has been undertaken in this area, it was not considered that suitable characterisation of environmental conditions has been established for the purpose of establishing a baseline of conditions as at or near the time of the transaction. ERM also understands that samples collected during groundwater monitoring have been taken with bailers and that metal samples collected during groundwater monitoring in recent years have not been field-filtered (Aurecon, 2012). Purging and sampling using bailers for the full suite of PCOCs considered in the course of this assessment is not recommended due to the difficulty of obtaining a representative groundwater samples owing from potential degassing of samples and the potential introduction of high levels of turbidity (NEPC 2013).

The PESA therefore recommended further assessment of this area via sampling of existing wells (using low-flow sampling and in-field filtering), and some limited additional intrusive assessment for soil characterisation.

#### *AEC Methodology and Investigation Field Observations*

Two soil investigation bores were advanced within this AEC to characterise fill materials on the perimeter wall of the ash repository. Mine overburden was encountered in both locations, consistent with known construction of the ash repository, with refusal encountered at 0.45m bgl on boulders at both locations. Six existing groundwater monitoring wells on the boundary of the ash repository were additionally sampled as part of this ESA. The sampling locations within this AEC are presented on *Figure 5.5 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining or odours were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil. Measured concentrations of ionisable volatile compounds via headspace analysis were noted in the two samples collected at 0.8 and 1.0 ppm v (isobutylene equivalent).

A summary of the field observations from the drilling works are presented within *Table 5.10* (below).

**Table 5.10** *Field Observations Summary – AEC MG*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MG_SB01	0.45	None	0.8
MG_SB02	0.45	None	1.0

Groundwater samples were collected from the seven existing monitoring wells located within this AEC. Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range, with the exception of pH. EC readings indicated that groundwater conditions were fresh in wells on the northern perimeter of the ash repository and saline in wells on the eastern perimeter of the ash repository, adjacent to the Lamberts North Ash Repository. The measured pH was slightly acidic (5.32 to 6.15) in most locations, with the exception of MG\_X\_4/D4 which had an acidic pH of 3.31. The acidic conditions at MG\_X\_4/D4 are likely related to the presence of mine spoil indicated on historical drawings (PPK, 2000). Borelogs for existing well MG\_X\_4/D4 also indicate this well is screened in mine overburden.

No indications of contamination, such as sheens or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Annex E*.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4g of Annex B*.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values. Asbestos was not detected in soils sampled within this AEC.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5g of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of all COPCs were below the laboratory LOR in all groundwater samples analysed, with the exception of metals.

Arsenic, boron, cadmium, chromium, copper, lead, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in most groundwater samples within this AEC. Boron, cadmium, lead and manganese were detected at concentrations in excess of the adopted human health (drinking water) screening values. Arsenic and nickel were detected at concentrations in excess of the adopted human health (drinking water and recreational) screening values.

#### *Discussion*

Groundwater is inferred to flow in a north-easterly direction, consistent with previous investigations. Neubecks Creek is situated within 100 m of the northern boundary of the ash repository and is the nearest surface water body and potential ecological receptor.

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

All seven of the groundwater monitoring wells reported metals concentrations greater than the adopted human health and/or ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, boron, chromium, cadmium, copper, lead, manganese, nickel and zinc. Arsenic, boron, chromium, cadmium, copper, lead, manganese and nickel concentrations in excess of the adopted human health (drinking water and/or recreational) screening values were also reported in a number of samples. Arsenic and nickel concentrations also exceeded the adopted human health (recreational) screening values.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*. This discussion also includes consideration of groundwater salinity.

#### **5.4.8** *MH - Lamberts North Ash Repository*

##### *Background*

The Lamberts North ash repository is an extension of the current ash repository located to the south-east and adjacent to the existing ash repository. The Lamberts North ash repository was constructed on former open cut mine workings which formerly extended to the base of the Lithgow Seam. The repository was constructed in 2013 with a 5 m fill layer above the base of the former mine, which was in direct contact with groundwater within the Lithgow Seam (SKM, 2010). The placement of fill material prior to ash deposition is intended to provide a barrier to groundwater infiltration of the ash, and prevent potential leaching of contaminants from the ash to groundwater. The repository receives dry ash with water used for dust control only.

It is noted that the construction of the Lamberts North Ash Repository was approved by the Minister for Planning and Infrastructure under the *Environmental Planning and Assessment Act 1979* (NSW). The conditions of approval include surface water and groundwater monitoring. A Water Management Plan (WMP, Connell Wagner, 2008) was approved as part of the planning approval. The WMP includes groundwater and surface water monitoring during construction and operation of the ash repository (as discussed in *Section 5.4.7*) along with a requirement to prepare and submit an annual report (including the results of monitoring) to NSW EPA.

Construction of was completed in May 2013 in the northern section of this AEC (see *Figure 5.6, Annex A*), with some ash placement, however this facility has not yet commenced full operations. The remainder of the Lamberts North AEC has not yet been developed for ash placement, and generally remains in the condition at the time of transfer from Centennial Coal at the closure of the former mine.

Two unlined coal washery reject ponds were constructed by Centennial Coal along the former drainage line (known as Huon's Gully). These were constructed on a disturbed creek bed and open cut mine filled with overburden, and are reportedly approximately 20 m deep from surface to former base level. Seepage from washery rejects ponds has the potential to enter groundwater. Potential contamination concerns to groundwater include impact from dissolved salts and heavy metals, and annual groundwater monitoring identified a marked increase in chloride concentrations in monitoring bore MPM4/D10 which is considered to be caused by seepage from the coal washery rejects (CDM Smith, 2012).

A drainage channel was constructed in mid-2013 to divert current surface water flow away from Huon's Gully, and along the boundary between Lamberts North and the ridge to the west. The intent of the drainage channel is to divert up-gradient surface water runoff around the ash repository, and the rejects ponds. This diverts any further inflows of water to the extension to the ash repository and a fresh water pond located to the south of the second washery rejects pond. The fresh water pond is separated from the coal washery reject ponds by a poorly battered earthen dam wall.

Delta management reported that the freshwater pond was temporarily used to direct water from the Huon Void. The freshwater pond is blocked from down-gradient drainage, and the ultimate receiver of waters from this pond is unclear.

As discussed in *Section 5.4.7*, seepage from the ash repository has the potential to be saline and contain dissolved salts and heavy metals.

However, as noted previously, the facility has been designed and constructed in a manner that reduces the potential for these impacts to reach groundwater (ie by filling the base of the former mine with 5 m of fill prior to placement, thus elevating the ash above the water table). Former coal mining operations have also been noted to be potential sources of these contaminants. These include the underground mine workings (goaf), located along the western boundary of the AEC, and the coal reject ponds located adjacent to the western boundary.

The *Preliminary ESA* (ERM, 2013) concluded that whilst some environmental assessment has been undertaken in this area, it was not considered that suitable characterisation of environmental conditions has been established, and further investigation was warranted to provide a baseline assessment of soil and groundwater conditions.

*AEC Methodology and Investigation Field Observations*

Four soil investigation bores were drilled within this AEC. Three of these were converted into groundwater monitoring wells. A surface sediment sample was also collected from the coal washery rejects pond (MH\_SS02). The sampling locations within this AEC are presented on *Figure 5.5* of *Annex A*. Relevant borehole logs are presented within *Annex D*.

No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 1.5 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

A summary of the field observations from the drilling works are presented within *Table 5.11*.

**Table 5.11** *Field Observations Summary - AEC MH*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm v - isobutylene equivalents)
MH_MW01	30	None	0.1- 2
MH_MW02	15.5	None	0.1-1.5
MH_MW03	28.5	None	0.1- 0.6
MH_SB04	0.65	None	0.4- 1.3

Six existing groundwater monitoring wells were additionally sampled as part of the ESA. A further three groundwater monitoring wells located on the boundary with the current ash repository, MG\_X\_4/D9, MG\_X\_4/D1 and MG\_X\_4/D10 are considered in this assessment. A surface water sample (MH\_SS01) was collected from a pond located to the south of the coal washery ponds.

Groundwater parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range, with the exception of pH. pH was slightly acidic to neutral (5.32 to 6.91) in most locations, with the exception of MH\_X\_D15 which had an acidic pH of 4.24. The groundwater from MH\_X\_D15 is likely influenced by (or potentially representative of) water quality conditions in the up-gradient mine goaf areas adjacent to the west.

Electrical conductivity measurements indicated that groundwater conditions were saline in wells north of, and down-gradient of, the coal washery ponds. Corresponding sodium and chloride concentrations were higher in these wells than upgradient wells (MH\_MW02, MH\_X\_D17, MH\_X\_D18) which also reported EC readings indicative of fresh water.

Evidence of hydrocarbon impact was observed in two wells in this AEC. A sheen was reported at MH\_X\_D15 after purging 3 L, and a strong hydrocarbon odour was noted at MH\_X\_D18 during purging.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 5.h of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 7 of Annex A*.

Measured concentrations of COPCs were below the adopted human health and ecological screening values in all soil samples collected from within this AEC. Hydrocarbon (TRH and PAH) compounds were detected above the laboratory LOR at a depth of 0.2 m bgl, 8 m bgl and 26 m bgl at MH\_MW01, a depth of at 12 m bgl at MH\_MW02, at a depth of 0.1 m bgl at MH\_SB04, and in a surface sample collected from the coal washery ponds (MH\_SS02). Concentrations of TRH and PAH compounds in all samples in this AEC were below the adopted screening values.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5.h of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the adopted screening values in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC. The measured concentrations of metals were below the adopted screening values in the surface water sample collected from MH\_SS01.

The majority of measured concentrations were below or close to the corresponding laboratory LOR. Concentrations of TRH C<sub>16</sub>-C<sub>34</sub> and TRH C<sub>34</sub>-C<sub>40</sub> were above the corresponding laboratory LORs in groundwater at MH\_X\_D18; however all concentrations were below the adopted screening values. Monitoring well MH\_X\_D18 is located down-gradient of the coal washery ponds, and is screened at a depth of 37.5 - 43.5 m bgl in shale bedrock.

Arsenic, boron, cadmium, chromium, copper, lead, manganese, nickel, zinc were detected in groundwater at concentrations in excess of the ecological screening values. Arsenic, lead, manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values. Manganese and nickel were detected in groundwater at concentrations in excess of the human health (recreational assessment) criteria.

#### *Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC. The detection of TRH and PAH in soil and groundwater is likely associated with the presence of coal in the mine overburden used to backfill these areas.

All seven of the groundwater monitoring wells reported metals concentrations greater than the adopted human health and/or ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, boron, cadmium, chromium, copper, lead, manganese, nickel, zinc. Arsenic, lead, manganese and nickel were detected in groundwater at concentrations in excess of the human health (drinking water) screening values. Manganese and nickel were detected in groundwater at concentrations in excess of the human health (recreational assessment) criteria.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5* including consideration of groundwater salinity.

5.4.9

**MI - Water Holding Ponds**

*Background*

Open ponds used to store and treat wastewaters are located within the central portion of the operational area. These are lined with HDPE to reduce the potential for wastewater loss, and monitoring bores are located near the ponds to facilitate detection of potential leakages.

During the PESA (ERM, 2013a), site management reported that monitoring results indicate that leakage has not occurred.

While routine groundwater monitoring has been undertaken in this area, further investigation was considered to be required to provide a baseline for soil and groundwater conditions in this area.

*AEC Methodology and Investigation Field Observations*

A total of seven soil investigation bores were drilled within this AEC. Based on the presence of existing monitoring wells, and a relatively low risk of contamination, additional groundwater monitoring wells were not deemed necessary. However, as no soil was data available for existing monitoring wells within this area, four investigation points were located in proximity to existing monitoring wells. Remaining boreholes were distributed to provide coverage of the area. The sampling locations within this AEC are presented on *Figures 5.3 and 5.5 of Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 0.6 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

A summary of the field observations from the drilling works are presented *within Table 5.12*.

**Table 5.12** *Field Observations Summary - AEC MI*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MI_SB02	0.8	None	0.1-0.4
MI_SB03	3	None	0-0.4
MI_SB04	3	None	0.1
MI_SB05	0.8	None	0.3-0.6
MI_SB06	1.3	None	0-0.1
MI_SB07	0.8	None	n/a <sup>^</sup>
MI_SB08	0.6	None	n/a <sup>^</sup>

<sup>^</sup> refusal encountered. Insufficient sample for duplicate to measure with PID due to coarse fill material (gravels and cobbles).

Groundwater field parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4.i of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR, with the exception of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> and total PAH. Concentrations of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> were above the corresponding laboratory LOR in soil collected from 0.2 m bgl at MI\_SB04, however all concentrations were below the adopted screening values. Concentrations of total PAHs were above the corresponding laboratory LOR in soil collected from 0.2 m bgl at MI\_SB04 and at 0.2 m bgl at MI\_SB06 however all concentrations were below the adopted screening values.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 4.i of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC.

Cadmium, copper, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological in groundwater samples collected from all groundwater monitoring wells within this AEC. Manganese and nickel were detected at concentrations in excess of the adopted human health (drinking water and recreational) in groundwater samples collected from several groundwater monitoring wells within this AEC.

*Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

All four of the groundwater monitoring wells reported metals concentrations greater than the adopted human health and ecological screening values. Metals exceeding the adopted ecological screening values included cadmium, copper, manganese, nickel and zinc. Manganese and nickel concentrations in excess of the adopted human health (drinking water and recreational) screening values were also reported in a number of samples.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

**5.4.10 MJ - Operational USTs***Background*

Four underground storage tanks (USTs) are present on site, containing diesel and petrol (E10), in the stores area, diesel generator and the mobile plant area. The USTs are understood to be approximately 20 years old and no information was available on their construction. Site management advised that tank integrity tests are undertaken routinely at the site and have not identified any issues. The USTs are located as follows:

- Petrol and diesel USTs near the main store (approx. 33 000L and 20 000L respectively);
- Diesel UST for the emergency generator (11 700L) and associated above ground day tank; and
- Diesel USTs at the mobile plant refuelling area (see *Section 5.4.5*).

Soil and groundwater investigations have been completed in the areas of underground tank infrastructure to ensure compliance with relevant underground petroleum storage system (UPSS) legislation.

Soil and groundwater investigations to date have been conducted around the underground fuel infrastructure, and did not include laboratory analysis of soils. Therefore further investigation was considered to be required to provide a baseline for soil and groundwater conditions in this area.

*AEC Methodology and Investigation Field Observations*

Six existing monitoring wells were sampled within this AEC. A total of three soil investigation bores, one of which was completed as a groundwater monitoring well, were advanced within this AEC. This AEC falls within the operational area, and also overlaps with Area MD (Workshops), these

investigation locations are therefore also discussed in the sections relevant to those AECs. Soil bores and monitoring wells were distributed around the perimeter of the AEC as presented in *Figure 5.3 of Annex A*. Relevant borehole logs are presented within *Annex D*.

Several proposed soil bores in Area MK adjacent to the diesel generator grid based locations were abandoned due to site infrastructure and the likely presence of underground services.

Monitoring well MK\_MW09 (MK\_SB42) was located presumed upgradient of the diesel UST. Soil bore MK\_SB24 was located adjacent to existing monitoring well MJ\_X\_MWMP1 to assess soil conditions adjacent to the petrol UST. Soil bore MD\_MW02 and monitoring well MD\_MW01 were located cross-gradient of existing wells around the petrol USTs.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 0.6 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

A summary of the field observations from the drilling works are presented within *Table 5.13*.

**Table 5.13** *Field Observations Summary - AEC MJ*

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
MK_SB42	6	None	0.1-1.2
MK_SB24	3	None	0.2-1.7
MD_MW01	7	None	0- 0.6
MD_MW02	1.8	None	1.6-1.8

Groundwater field parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

*Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4j of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in all soil samples collected from within this AEC.

The majority of measured concentrations were below or close to the corresponding laboratory LOR, with the exception of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> and total PAH. Concentrations of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> were above the corresponding laboratory LOR in soil collected from 2.0 m bgl at MD\_MW04, however all concentrations were below the adopted screening values. Concentrations of total PAHs were above the corresponding laboratory LOR in soil collected from 2.0 m bgl at MD\_MW04 and at .04 m bgl at MK\_SB42 however all concentrations were below the adopted screening values.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC however all concentrations were below the adopted screening values.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 5j of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed, with the exception of metals, BTEX and TRH in groundwater. Concentrations of some TRH fractions were above the corresponding laboratory LOR in groundwater from monitoring well MJ\_X\_MWMP1 and MK\_MW09, however all concentrations were below the adopted screening values.

The concentration of benzene in groundwater at MJ\_X\_MWMP1 was in excess of the human health (drinking water) screening values.

Arsenic, copper, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from all groundwater monitoring wells within this AEC. Manganese and nickel were detected at concentrations in excess of the adopted human health (drinking water) screening values in groundwater samples collected from several groundwater monitoring wells within this AEC.

#### *Discussion*

No exceedences of the adopted ecological or human health screening values were identified in soil samples collected from within this AEC.

Groundwater from most monitoring wells within this AEC reported metals concentrations greater than the adopted ecological screening values.

Metals exceeding the adopted ecological screening values included arsenic, copper, manganese, nickel and zinc. Magnesium and nickel concentrations in excess of the adopted human health (drinking water) screening values were also reported in a number of samples.

Benzene was detected at concentrations in excess of the adopted human health (drinking water) screening values in groundwater at MJ\_X\_MWMP1 adjacent to a UST and fuel bowsers. The benzene exceedence at this location is attributable to the UST and associated fuel lines or possible surface spills. It is recommended that the integrity of the UST and lines in this location be tested to assess the potential for sub-surface leaks. As groundwater in the vicinity of the Site is not extracted for drinking water, the presence of benzene in excess of the adopted human health (drinking water) screening values is not considered to represent a significant risk to humans under the ongoing use of the Site as a power station.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

#### **5.4.11 MK - Accessible Operational Areas**

##### *Background*

The main operational area of the Site was constructed on former open cut coal mine workings. Historical maps of the Site indicating the approximate location of former open cut mines and underground workings are provided in PPK (2000), and are represented in *Figure 4, Annex A*. The former open cut workings were reportedly filled with mine overburden and mine wastes. Although there are no available records of the material used for backfill, borelogs from installations of monitoring wells, and from previous investigations (PB, 2012) corroborate the use of mine overburden as backfill. Along with mine overburden, it is feasible that other smaller waste streams used as backfill may be contributing to elevated salt, metals and acidity in groundwater.

It is also feasible that isolated areas of contamination relating to previous mine operation may remain at the facility. Historical activities with the potential to cause isolated contamination issues include maintenance, chemical storage and refuelling. Targeted activities within the operational area include transformers (Area MC), fuel tanks (Area ME and MF) and workshops (Area MD).

Given the history of mining operations, and power station operations, and the lack of existing investigation data for this AEC, the PESA considered further investigation to be required to provide a baseline and to assess the potential for soil and groundwater contamination.

*AEC Methodology and Investigation Field Observations*

Seventy-three soil investigation bores were advanced across the operational area in a general grid pattern. Areas with high electrical hazards (i.e electrical transformers) and key operational areas of the plant (including the cooling towers) were excluded from the intrusive works, with sampling locations distributed around the perimeter of these areas. Several proposed grid based locations were abandoned due to physical access restraints from site infrastructure, the presence of underground services and areas where underground services were suspected and could not be confirmed. Several soil bores were terminated before the target depth of 3 m due to refusal on fill material (typically mine overburden). Nine soil bores were advanced beyond 3m and completed as groundwater monitoring wells to provide a general coverage of groundwater conditions within this area. The sampling locations within this AEC are presented on *Figures 5.3 and 5.4 of Annex A*. Relevant borehole logs are presented within *Annex D*.

Field indicators of contamination, such as staining, odours or visibly stressed vegetation were not typically noted within this AEC. The exception to this was an odour from 0.8-1.2m bgl within fill material at location MK\_SB87, with no staining was evident at this location. No staining or unusual odours were detected at any depth through the sampled soil profile at other locations within this AEC. Measured concentrations of ionisable volatile compounds via headspace analysis did not generally exceed 4 ppm v (isobutylene equivalent) in soil samples collected from this AEC. The highest concentration of ionisable volatile compounds was measured at a depth of 1.4, bgl at MK\_SB87 at 262.6 ppm v, associated with an odour detected at 0.8-1.6 m bgl.

A summary of the field observations from the drilling works are presented within *Table 5.14*.

Groundwater field parameter readings collected during the groundwater sampling works are presented in *Table 3 of Annex B*. Field parameters were generally within the expected range in this AEC. Electrical conductivity readings indicated fresh water conditions.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within *Table 3 of Annex B*.

#### *Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4k of Annex B*.

Measured concentrations of all COPCs with the exception of TRH C<sub>10</sub>-C<sub>16</sub> and TRH C<sub>16</sub>-C<sub>34</sub> (discussed below) were below the adopted screening values in all soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR.

Concentrations of some TRH fractions were above the corresponding laboratory LOR in soil collected from 0.2 m bgl at MK\_SB62, 0.4 m bgl at MW\_SB61, 1.0 m bgl at MK\_SB35 and 1.0 m bgl at MK\_SB87. All concentrations were below the adopted screening values with the exception of TRH C<sub>10</sub>-C<sub>16</sub> which exceeded the adopted ESLs at 1.0 m bgl at MK\_SB87. Concentrations of xylene were above the corresponding laboratory LOR in soil collected from 3.9 m at MK\_SB78 and 1.0 m bgl at MK\_SB87, however all concentrations were below the adopted screening values.

Concentrations of various heavy metals were identified above the corresponding laboratory LOR in a number of soil samples collected from within this AEC. All concentrations were below the adopted screening values, with the exception of copper in a sample collected from 1.5 m bgl at MK\_SB33 which exceeded the adopted EIL.

#### *Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 4k of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed, with the exception of metals, PAH and TRH in groundwater. Concentrations of some TRH fractions were above the corresponding laboratory LOR in groundwater from monitoring well MK\_MW05 and MK\_MW09, however all concentrations were below the adopted screening values.

Concentrations of some PAHs were above the corresponding laboratory LOR in groundwater from monitoring well MK\_MW05, however all concentrations were below the adopted screening values.

Arsenic, cadmium, copper, lead, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from several groundwater monitoring wells within this AEC. Manganese and nickel were detected at concentrations in excess of the adopted human health (drinking water and recreational) screening values in groundwater samples collected from several groundwater monitoring wells within this AEC. The adopted human health (drinking water) screening values were also exceeded for arsenic at MK\_MW06 and lead at MK\_MW07.

#### *Discussion*

No exceedences of the adopted human health screening values were identified in soil samples collected from within this AEC. The ecological screening values were exceeded at MK\_SB86 and MK\_SB33.

The measured concentration of TRH C<sub>10</sub>-C<sub>16</sub> exceeded the adopted ESLs at 1.0 m bgl at MK\_SB87, located on the western side of the main plant, behind Unit 2. Operational activities in this area include a washdown pit and day maintenance building. The concentration of TRH in soil was below the adopted human health screening values, TRH was not detected above the laboratory LOR in groundwater at this location (MK\_MW04). It was noted that vegetation in this area is limited to grass on landscaped areas. Grasses have a shallow root zone and impacts at a depth of 1.0 m bgl are therefore considered unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a power station.

Copper concentrations marginally exceeded ecological criteria in shallow soil sampled from 1.5 m bgl at MK\_SB33. It is noted that the concentration of copper in the shallower sample at 1.0 m bgl at this location was below the adopted ecological criteria, with a concentration of 6 mg/kg which was marginally above the laboratory LOR of 5 mg/kg. This exceedence is likely attributed to the presence of fill materials sourced from mine overburden which is ubiquitous across the Site but heterogeneous in composition.

The copper concentrations in soils from 1.5 m bgl in Area MK were all <250% of the ecological screening criteria and the 95% UCL of the mean concentration was less than the adopted EIL. It is also noted that the standard deviation of these samples was less than 50% of the adopted EIL (refer to *Annex I* for details of all relevant calculations). These impacts are therefore considered unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a power station.

Groundwater from all monitoring wells within this AEC reported metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, cadmium, copper, lead, manganese, nickel and zinc. Arsenic and lead, concentrations in excess of the adopted human health (drinking water) screening values and nickel concentrations in excess of the adopted human health (drinking water and recreational) screening values were also reported in a number of samples.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

#### **5.4.12 *ML - Non Operational Areas (including Buffer Lands & Former Contractors Yard)***

##### *Background*

This AEC includes buffer lands outside of the fence operational area of the main Site which are largely un-used. Current infrastructure in these areas includes a Trans-grid substation and overhead transmission lines. There are three former landfills located in the buffer lands, which are addressed in AEC MA (*Section 5.4.1*). The buffer lands include areas which have been extensively mined. This includes underground mine workings and former open cut mines which have been partly or fully backfilled with mine overburden. The location and extent of former mine workings on- and off-site are illustrated in *Figure 4, Annex A*. Connell Wagner (2008) reported that groundwater associated with the underground mine goaf<sup>1</sup> has been characterised by elevated concentrations of sulfate, the metalloid boron, and the metals manganese, nickel and zinc.

The buffer lands are characterised by steep terrain with dense vegetation, and access to these areas was limited to areas immediately adjacent to roads and tracks. Former mine infrastructure may be present in inaccessible parts of the buffer lands. This includes structures which appear to be water treatment dams to the north of the Site. Interviews with site staff indicated that these areas are largely un-used, aside from access to transmission lines and substations.

During construction of the power station, temporary contractors yards were established around the perimeter of the current operational area. Infrastructure associated with these areas likely included site sheds, workshops, machinery and parts maintenance, fuel and chemical storage and septic tanks.

---

<sup>1</sup> The goaf areas are the underground mine areas where coal pillars have been partially mined and the roof allowed to collapse.

Given the absence of previous environmental characterisation work, the PESA (ERM, 2013a) recommended that a broad-scale assessment of potential contamination be undertaken to provide a baseline and to assess the potential for soil and groundwater contamination within this AEC.

The former contractors yards to the north and east of the operational were assessed in *Section 5.4.11* (MK - Operational Areas) and *Section 5.4.6* (MF - Operational ASTs). The former contractors yards to the west of the operational area are outside of the boundary of the Site.

#### *AEC Methodology and Investigation Field Observations*

Seven soil bores were advanced within the formers contractors' yard; two of which were completed as groundwater monitoring wells. The contactors yard is situated on a hill approximately 20 m above the operational area and shale and coal was observed to outcrop at the surface. Due to the presence of shallow bedrock, surface soil was subsequently sampled at an additional 16 locations to provide an assessment of potential soil contamination within this area.

A total of seven soil investigation bores were advanced within the buffer areas of the site, and six completed as groundwater monitoring wells. One surface soil sample was additionally collected within the buffer area.

For the purpose of discussion of groundwater results, monitoring wells from Area MG and MA have been included where they are located within the buffer lands. The sampling locations within this AEC are presented on *Figures 5.1, 5.2 and 5.4* of *Annex A*. Relevant borehole logs are presented within *Annex D*.

No field indicators of contamination, such as staining, odours or visibly stressed vegetation were noted within this AEC. No staining or unusual odours were detected at any depth through the sampled soil profile. Measured concentrations of ionisable volatile compounds via headspace analysis were noted not to exceed 3.3 ppm v (isobutylene equivalent) in any soil sample collected from this AEC.

A summary of the field observations from the drilling works are presented within *Table 5.15*.

Table 5.15 Field Observations Summary – AEC ML

Borehole ID	Depth (m bgl)	Visual or Olfactory Evidence	PID Range (ppm)
ML_MW02	0.6	None	0- 0.1
ML_MW03	24.5	None	n/a^
ML_MW05	18.1	None	0-0.2
ML_MW07	5.0	None	0.2-1.8
ML_MW10	16.0	None	1.3-1.8
ML_MW12	8.0	None	0-0.7
ML_MW14	0.2	None	0-0.2
ML_MW15	15.9	None	0-1.9
ML_MW17	0.4	None	n/a^
ML_MW18	0.75	None	n/a^
ML_MW19	0.25	None	n/a^
ML_MW20	24.0	None	n/a^
ML_MW21	30.0	None	n/a^
ML_SB22	0.1	None	0-1.1
ML_MW23	0.3	None	n/a^
ML_MW24	0.45	None	0.0

ML_SB39	0.15	None	0.0
ML_SB40	0.15	None	0.0

^Insufficient sample for duplicate to measure with PID due to coarse fill material (gravels and cobbles) and/or refusal on bedrock.

Groundwater field parameter readings collected during the groundwater sampling works are presented in Table 3 of Annex B. Field parameters were generally within the expected range in this AEC. Electrical conductivity measurements indicated fresh water conditions in most locations, with the exception of ML\_MW05 which indicated saline conditions. The saline conditions at ML\_MW05 may be influenced by or potentially indicative of water quality in mine goaf areas located to the east. The measured pH was slightly acidic in most locations, with the exception of MG\_X\_4/D4 which had an acidic pH of 3.31. The acidic conditions at MG\_X\_4/D4 are likely related to the presence of mine spoil indicated on historical drawings. Borelogs for existing well MG\_X\_4/D4 also indicate this well is screened in mine overburden.

No indications of contamination, such as sheen or odours, were observed during groundwater sampling within this AEC. A summary of field observations from the groundwater sampling works are presented within Table 3 of Annex B.

*Soil Analytical Results*

The soil analytical results have been compared to the adopted human health and ecological screening values as presented in *Table 4.1 of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in the soil samples collected from within this AEC. The majority of measured concentrations were below or close to the corresponding laboratory LOR.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of soil samples collected from within this AEC. All concentrations were below the adopted screening values, with the exception of copper, nickel and zinc in samples collected at 0.05 m bgl at ML\_SB36 which exceeded the adopted EIL.

*Groundwater Analytical Results*

Groundwater analytical results compared to the adopted screening values are presented in *Table 4.1 of Annex B*. Exceedences of the adopted screening values are also graphically presented in *Figure 8.1 to 8.9 of Annex A*.

Measured concentrations of the majority of the COPCs were below the laboratory LOR in all groundwater samples analysed. The exceptions to this were some detections of metals within groundwater across this AEC, and PAHs, TRH at MK\_MW05. Concentrations of PAHs and some TRH fractions were above the corresponding laboratory LOR in groundwater from monitoring well MK\_MW05, downgradient of the former contractors yard, however all concentrations were below the adopted screening values. Groundwater at MK\_MW05 was encountered within shale with interbedded coal and the detection of TRH and PAH in this location can be attributed to the background concentrations of hydrocarbons present in coal. Arsenic, cadmium, copper, lead, manganese, nickel and zinc were detected at concentrations in excess of the adopted ecological screening values in groundwater samples collected from all groundwater monitoring wells within this AEC. At MG\_X\_4/D4 the measured concentration of chromium also exceeded the adopted ecological screening values. Arsenic, lead, manganese and nickel were detected at concentrations in excess of the adopted human health (drinking water) screening values in groundwater samples collected from several groundwater monitoring wells within this AEC. At MG\_X\_4/D4 the measured concentration of cadmium also exceeded the adopted human health (drinking water) screening values. Arsenic in groundwater at MG\_X\_4/D4 and manganese in groundwater from several groundwater monitoring wells within this AEC was detected at concentrations in excess of the human health (recreational) screening values.

*Discussion*

No exceedences of the adopted human health screening values were identified in soil samples collected from within this AEC. Copper, nickel and zinc concentrations exceeded ecological criteria in shallow soil sampled from 0.05 m bgl at ML\_SB36.

The copper and nickel concentrations at ML\_SB36 were >250% of the ecological screening criteria. Red sand was present at the surface at ML\_SB36, extending from a nearby workshop building and covering an area of approximately 100 m<sup>2</sup>. This sand is likely a product of grit blasting on open ground from historical operations relating to Site construction activities.

Shale bedrock outcrops were observed at the surface in this area, with shallow soils typically less than 0.5 m bgl in this area. Photographs of the ground conditions in this AEC are presented in *Annex G*. There is limited soil to support plant growth, and it is unlikely to represent an area of high ecological significance. These impacts are considered unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a Power Station.

All groundwater monitoring wells reported metals concentrations greater than the adopted ecological screening values. Metals exceeding the adopted ecological screening values included arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc. Arsenic, lead, manganese and nickel concentrations in excess of the adopted human health (drinking water) screening values were also reported in a number of samples. Manganese concentrations also exceeded the adopted human health (recreational) screening values in groundwater from several groundwater monitoring wells.

At MG\_X\_4/D4 the measured concentration of cadmium also exceeded the adopted human health (drinking water) screening values, and arsenic concentrations in groundwater at MG\_X\_4/D4 also exceeded the human health (recreational) screening values.

As metals have been identified at concentrations exceeding the adopted screening criteria in groundwater within all AECs a consolidated discussion of this issue is presented in *Section 5.5*.

#### **5.4.13 MM - Water Assets (Lake Lyell and Thompsons Creek Reservoir)**

*Background*

The Coxs River was dammed downstream of Lake Wallace to form Lake Lyell in 1982. Lake Lyell has an active capacity of approximately 31 GL, sourced from local runoff. The water is also pumped to off-stream storage at Thompsons Creek, which supplies Mt Piper, or to Lake Wallace, which supplies Wallerawang Power Station.

There are currently three local farmers with agreements to agist stock within the buffer lands around Lake Lyell. Lithgow City Council owns a portion of lands adjacent to Lake Lyell, as well as leasing additional lands which are publicly accessible for camping and recreation.

Thompsons Creek Reservoir is located approximately 8 km south-west of the operational area of Mt Piper Power Station. The reservoir was constructed in 1992 on Thompsons Creek to provide off-stream storage for supply of the water to Mt Piper and Wallerawang. Although the surface runoff catchment of Thompson Creek is relatively small, Thompsons Creek Reservoir has a storage capacity of up to 27.5 GL with water routinely pumped from Lake Lyell.

The reservoir is also available to the public for recreational fishing. Surrounding buffer lands are generally vacant vegetated lands, with some areas used for stock grazing by local farmers under agreements with Delta.

The Coxs River catchment includes several current and historical coal mine operations, the Mt Piper Power Station and Wallerawang Power Station, and is highly disturbed. The Coxs River runs from north to south, and is dammed at Lake Wallace and Lake Lyell to provide water supply for the Delta Electricity Power Stations and other uses.

The PESA (ERM, 2013) noted that selenium monitoring had been conducted in Lake Lyell. However, given the numerous potential sources of contaminants and the presence of recreational users of Lake Lyell, further investigation was considered warranted to provide a baseline assessment of conditions for this area.

The PESA (ERM, 2013) noted that there had been no surface water or sediment investigations undertaken at Thompsons Creek Reservoir, and further investigation was therefore considered warranted to provide a baseline assessment of conditions for this area.

#### *AEC Methodology and Investigation Field Observations*

Samples were collected between 21 November and 22 November, 2013 from a total of 7 sampling locations. Sampling locations were distributed around the AEC as shown in *Figure 5.6 of Annex A*.

Sediment and surface water field notes are presented in *Annex E*. A summary of the field parameters recorded during the surface water sampling is presented in *Table 5m of Annex B*.

The depth to sediment in Lake Lyell ranged from approximately 1.0 m to 18.0 m and from approximately 7.5 m to 11.0 m in Thompson Creek Reservoir. Three of the four sediment samples collected in Lake Lyell were clay with trace to some silt.

The fourth consisted of silt with some gravel. Sediments in Thompsons Creek Reservoir were coarser and more variable, with sediments ranging from clay with some silt and gravel to gravel with some silt and clay.

No field indicators of contamination, such as staining, sheen, or odours were noted within this AEC.

#### *Sediment Analytical Results*

The sediments were analysed for grain size, phenols, TRH, BTEX, PAHs, and metals. The sediment analytical results were compared to the ANZECC (2000) ISQG-Low and ISQG-High values. The sediment analytical results compared to the adopted screening values are presented in *Table 4m of Annex B*.

Measured concentrations of COPCs were below the ISQG-High in all sediment samples, however, the concentrations of metals exceeded the ISQG-Low in some samples. The majority of measured concentrations were below or close to the corresponding laboratory LOR, with the exception of metals.

Phenol and BTEX concentrations were less than the laboratory LOR and the adopted screening values in all sediment samples. PAH concentrations were less than the laboratory LOR. However, it is noted that due to the moisture content of the samples the laboratory LOR were greater than the ISQG-Low for some of the PAHs in the analytical suite and, in a smaller subset, greater than the ISQG-High.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of sediment samples collected from within this AEC. All concentrations were below the adopted screening values in Lake Lyell, with the exception of copper, nickel and zinc concentrations at one location, MM\_SS21, which exceeded the ISQG-Low; however all concentrations were below the ISQG-High. All concentrations were below the adopted screening values in Thompsons Creek Reservoir with the exception of copper and lead concentrations which exceeded the ISQG-Low in one location, MM\_SS40; however all concentrations were below the ISQG-High.

For the purposes of this assessment, and given the small data set, the ISQG values have not been normalised to 1% TOC, as recommended in ANZECC (2000). The purpose of normalising to 1% TOC is to account for the reductions in bioavailability that can be associated with the presence of organic matter in sediment. As shown in *Table 5m of Annex B*, measured TOC values across the sampling area ranged between 0.7% and 5.44% TOC, with two samples in Thompsons Creek Reservoir having less than 1% TOC.

There were no applicable Australian screening values identified for selenium in sediments. The measured selenium concentrations were however less than the laboratory LOR (5 mg/kg) in all samples collected from Lake Lyell and Thompsons Creek Reservoir.

As there are no current applicable screening values for TRH in sediment in fresh water environments, the screening values for TRH in the Commonwealth of Australia (2009) *National Assessment Guidelines for Dredging* have been adopted for screening purposes. Measured concentrations of TRHC<sub>10-C<sub>36</sub></sub> in Thompsons Creek Reservoir were below the adopted screening value. Measured concentrations of TRHC<sub>10-C<sub>36</sub></sub> in sediments from Lake Lyell were below the adopted screening value, with the exception of the sample collected from MM\_SS21. The concentration of TRHC<sub>10-C<sub>36</sub></sub> at MM\_SS21 marginally exceeded the adopted screening value, with a concentration of 590 mg/kg. It is noted that the adopted screening level is applicable to marine environments, and as such the marginal exceedences of this screening value is not considered to represent a significant issue and is considered unlikely to be attributable to site operations at Mt Piper.

#### *Surface Water Analytical Results*

The surface water samples were analysed for phenols, TRH, BTEX, PAHs, and metals. The surface water analytical results were compared to the adopted ecological and human health (drinking water and recreational) screening values, as discussed in *Section 3.5.2*. The surface water analytical results compared to the adopted screening values are presented in *Table 5m of Annex B*.

Measured concentrations of COPCs were below the adopted screening values in the surface water samples collected from within this AEC, with the exception of metals. The majority of measured concentrations were below or close to the corresponding laboratory LOR. Phenol, BTEX, and PAH concentrations were less than the laboratory LOR and the adopted ecological and human health (drinking water and recreational) screening values in all surface water samples, with the exception of benzo(a)pyrene for which all concentrations were less than the LOR, but the LORs were not always lower than the recreational screening value.

Measured concentrations of various heavy metals were above the corresponding laboratory LOR in a number of surface water samples collected from within this AEC. All concentrations were below the adopted screening values, with the exception of copper and zinc. Copper concentrations exceeded the adopted ecological screening values in all surface water samples from Lake Lyell and Thompsons Creek Reservoir. However, all copper concentrations were below the human health (drinking water and recreational) screening values.

Zinc concentration exceeded the adopted ecological screening values in one sample from Thompsons Creek Reservoir. However, all zinc concentrations were below the human health (drinking water and recreational) screening values.

The mercury concentration was less than the laboratory LOR in all of the surface water samples collected; however, the LOR (0.1 µg/L) was greater than the ecological screening criteria (0.06 µg/L). There was a similar issue for selenium, but a lower laboratory LOR was obtained for a limited number of samples and there were no exceedences of the ecological screening criteria noted among those samples.

#### *Discussion*

##### *Sediment*

As noted in Simpson *et al.* (2005), the ISQG-Low represent concentrations below which the frequency of adverse biological effects is expected to be very low, while the ISQG-High represent concentrations above which adverse biological effects are expected to occur more frequently. If a detected concentration exceeds the relevant ISQG, it does not necessarily mean that adverse biological effects will occur, but rather that more detailed consideration of the results may be required.

The exceedences of the ISQG-Low for copper, nickel, and lead in sediments in Lake Lyell and Thompsons Creek Reservoir are likely representative of background conditions in the respective catchment(s).

The metal concentrations in sediments in Lake Lyell are generally consistent with those reported by Birch *et al.* (1999), with the exception of copper and nickel concentrations measured at MM\_SS21, which were approximately two times the ISQG-Low. It is not possible to determine if the exceedences of the copper, nickel, and zinc ISQG-Low noted in Lake Lyell are due to natural variability in background concentrations or to a localised point source. Other contributing sources to Lake Lyell include the tributary Farmers Creek, which receives inputs from various industries and a sewage treatment plant. Birch *et al.* (1999) also noted metals impacts in sediments in Farmers Creek.

Thompsons Creek Reservoir is located in the headwaters of the catchment, which include surface run-off from grazing lands, and is upgradient of power generation infrastructure. Although water is piped from Lake Lyell, the metal exceedences measured in sediment in the Reservoir are considered likely to be representative of background concentrations in the catchment rather than anthropogenic inputs.

##### *Surface Water*

Given that copper concentrations marginally exceeded the ANZECC (2000) trigger values for the protection of 95% of freshwater species at most locations, it is considered likely that the concentrations are representative of background conditions. The concentration of zinc at MM\_SS40 only marginally exceeded the adopted screening values.

The surface water results do not suggest that there has been significant anthropogenic impact on surface water quality in Lake Lyell or Thompsons Creek Reservoir.

## 5.5 *METAL AND METALLOID CONCENTRATIONS IN GROUNDWATER*

### 5.5.1 *Assessment of Background Conditions*

Metals and metalloids can occur naturally in groundwater, and an assessment of background conditions forms an integral part of the evaluation of metal and metalloid concentrations reported. This is especially relevant where potential off-site sources of metals and metalloids exist, including historical and current underground coal mining works which occur extensively in the vicinity of the Site. Mining activities may alter the hydrological system and intensify surface water and groundwater connectivity. Increased interaction on freshly exposed rock in fractures and fracture zones has the potential to mobilise elements from the rock mass (Jankowski, 2007).

Given that metals concentrations in groundwater exceeded one or more of the adopted human health and/or ecological screening values in most monitoring wells across the Site, the results have also been assessed in the context of background conditions, taking into account results from available background monitoring wells.

The local geology and historical coal mining activities have impacted on the quality of groundwater at the Site. Connell Wagner (2008) reported that groundwater associated with the underground mine goaf<sup>2</sup> (located predominantly to the east of the main operational area of the Power Station and to the south of the current ash repository) has been characterised by elevated concentrations of sulfate, the metalloid boron, and the metals manganese, nickel and zinc. In addition to the former underground and open cut mine workings located on the Site, potential mining related sources of metals and metalloids (including arsenic and boron) include the up-gradient surrounding areas to the south-west and west of the Site. Further potential sources include the coal fines rejects emplaced on the western edge of the Lamberts North ash repository and the current ash repository.

The concentrations of metals in groundwater have been compared to these background wells (as applicable), and for the purposes of this assessment, concentrations equalling or exceeding the maximum background concentrations by a factor of two were considered as potentially indicative of concentrations above background values. Background monitoring wells have been selected from two sets of wells:

---

<sup>2</sup> The goaf areas are the underground mine areas where coal pillars have been partially mined and the roof allowed to collapse.

- *Site Background Monitoring Wells* – these wells are located up-hydraulic gradient of all identified on-site sources at the site. These include MA\_MW01, ML\_MW05, ML\_MW10 and ML\_MW12. pH levels and ORP (two key controls on metal and metalloid solubility) in the aforementioned monitoring wells fell within the mid-range of measurements recorded across the monitoring well network at the Site, with pH measurements from the background monitoring wells varying between 6.1 to 6.9 and ORP between -85 mV and 75 mV. These monitoring wells were considered as the general background data points for the Site.
- *Ash Repository Background Monitoring Wells* – these wells are considered representative of background conditions in the north eastern section of the Site in the vicinity of the current ash repository where impact to groundwater from former mining activities have previously been reported (Connell Wagner, 2008; Aurecon, 2012). These include monitoring wells located upgradient from the current ash repository (MG\_X\_4/D5 and MG\_X\_MP1). Note that these monitoring wells were considered primarily for metal(loids) with elevated concentrations in the vicinity of the current ash repository.

It is noted that the a limited number of monitoring wells are available as background monitoring wells and that only one round of data is available for comparison of reported concentrations from these monitoring wells to the rest of the monitoring network established during the Stage 2 ESA. The evaluation of metal(loid) concentrations in relation to background conditions based on the approach outlined here should therefore be seen as a preliminary review of background conditions given the relatively limited nature of the background dataset. While the background dataset is limited, the approach does allow for the preliminary identification of potential background conditions.

The following discussion assesses the results for each metal(loid) initially in terms of exceedences of the adopted screening values; and secondly, where background concentrations exceed the adopted screening values, the data were then evaluated against the background concentrations. This is followed by a consolidated discussion on the overall distribution of metal(loid) concentrations across the Site.

#### *Arsenic*

The concentration of arsenic in groundwater exceeded the lowest adopted screening value (human health (drinking water)) in 13 of the 70 monitoring wells sampled, with the majority of these exceedences observed in monitoring wells located in the eastern area of the main operational area at the Power Station. Of these, the concentration of arsenic was above a factor of two of the maximum reported background concentration in five monitoring wells, indicating that the presence of arsenic in groundwater at these locations may represent a potential risk greater than that which can be attributed to local background conditions.

Generally, the highest arsenic concentrations were reported for monitoring wells located in the eastern area of the main operational area at the Power Station (MC\_MW04, MW-MW04, MJ\_X\_MWMP5 and MK\_MW11), and one monitoring well (MG\_X\_4/D4) located to the north east of the coal storage area and directly downgradient of a remnant mine spoil dump. No monitoring wells located in the vicinity of the current ash repository exceeded the maximum concentration from the Site Background Monitoring Wells.

#### *Boron*

Boron concentrations exceeded the lowest adopted screening value (ecological) in four monitoring wells (MG\_X\_4/D1, MG\_X\_4/D9, MG\_X\_4/D10 and MH\_MW03) located directly to the east and downgradient of the current ash repository. The boron concentrations in these four monitoring wells were between a factor of seven and more than an order of magnitude above the maximum concentration reported for the Ash Repository Background Monitoring Wells.

The highest boron concentration of 4,150 µg/L was reported for MG\_X\_4/D10, a monitoring well that is located cross-gradient of the current ash repository and down-gradient of the underground mine goaf located directly to the south of the ash repository. The other locations with elevated boron concentrations, MG\_X\_4/D1, MG\_X\_4/D9 and MH\_MW03 were located down-gradient of MG\_X\_4/D10 and the underground mine goaf areas.

#### *Cadmium*

Cadmium concentrations exceeded the lowest adopted screening value (ecological) in 19 of the 70 monitoring wells sampled, with exceedences of the adopted screening values in monitoring wells spread across the Site, including the main operational area of the Power Station, non-operational areas and the current ash repository area. Of these, the concentration of cadmium was a factor of two above the maximum reported background concentration in four monitoring wells. The highest reported cadmium concentrations were located directly downgradient of a remnant mine spoil dump to the north east of the coal storage area (MG\_X\_4/D4), upgradient of the current ash repository (MG\_X\_MP1), and adjacent to the underground mine goaf within the former Huons Gully (MG\_X\_4/D10 and MH\_X\_D15).

#### *Copper*

Copper concentrations in groundwater exceeded the lowest adopted screening values (freshwater) at 32 of the 70 monitoring wells sampled, with exceedences located across the Site, including the main operational area, non-operational areas and the current ash repository area. It is however noted that none of the samples exceeded the screening values for drinking water (2,000 µg/L). The concentration of copper was a factor of two above the maximum reported background concentration at ten monitoring wells, located

between the coal storage area and the water holding ponds (MJ\_X\_MWMP6, MI\_X\_5/D8, MI\_X\_5/D5, MG\_X\_MP1), near the operational ASTs (MF\_MW03), near a remnant mine spoil dump to the north east of the coal storage area (MG\_X\_4/D4, ML\_MW07), and in the former Huons Gully adjacent to the current ash repository (MH\_X\_D15, MG\_X\_4/D10, MH\_MW01).

The current ash repository does not appear to be a significant source of copper to groundwater given that the highest copper concentration was reported for monitoring well MG\_X\_MP1 located upgradient of the current ash repository.

#### *Lead*

Lead concentrations exceeded the lowest adopted screening values (freshwater) at 11 of the 70 monitoring wells sampled. Of these, the concentration of lead was a factor of two above the maximum reported background concentration at three monitoring wells. These three monitoring wells are located in the electrical transformers area (MC\_MW02), adjacent to the coal conveyor and coal crushing area (MK\_MW07) and to the north east of the coal storage area and directly downgradient of a remnant mine spoil dump (MG\_X\_4/D4).

#### *Manganese*

Manganese concentrations in groundwater in the majority of monitoring wells (59/70) exceeded the lowest adopted screening value (human health (drinking water)). The reported manganese concentrations were a factor of two above the maximum reported background concentration in one monitoring well (MI\_X\_5/D5) located directly downgradient of a wastewater pond.

#### *Nickel*

Nickel concentrations in groundwater in the majority of monitoring wells (66/70) exceeded the lowest adopted screening values (ecological). The reported concentrations were a factor of two above the maximum reported background concentration at four monitoring wells between the coal storage area and the water storage ponds (MI\_X\_5/D2, MK\_MW02, MK\_MW03, MK\_MW06), and seven monitoring wells located downgradient of the underground mine goaf and the current ash repository. The concentration of nickel in monitoring wells downgradient of the current ash repository (MG\_X\_4/D1 and MG\_X\_4/D9) is within a similar range to monitoring wells in the former Huons Gully downgradient of the underground mine goaf (MH\_MW01, MH\_MW03, MH\_X\_D15, MH\_X\_D19).

All seven monitoring wells downgradient of the underground mine goaf and the current ash repository had reported concentrations greater than a factor of two of the maximum reported concentration for the Ash Repository Background Monitoring Wells.

*Zinc*

Zinc concentrations in the majority of monitoring wells (67/70) across the Site exceeded the adopted screening value (ecological). The reported concentrations were a factor of two above the maximum reported background concentration at 18 monitoring wells across the site, including the water holding pond area, operational ASTs area, the main operational area of the Power Station, the coal storage area and the area located to the east of the current ash repository and underground mine goaf.

Zinc concentrations exceeded the maximum reported concentration for the Ash Repository Background Monitoring Wells at to MH\_X\_D15 located downgradient and to the east of the underground mine goaf (and upgradient of the current ash repository), monitoring well MG\_X\_4/D10 located in the former Huons Gully downgradient of the underground mine goaf and monitoring well MI\_X\_5/D5 located downgradient of a wastewater holding pond.

The highest zinc concentrations were observed in monitoring well MH\_X\_D15, located in the former Huons Gully, downgradient of the underground mine goaf and upgradient of the current ash repository. The concentrations of zinc in groundwater decrease in a north easterly and downgradient direction from MH\_X\_D15 to MH\_X\_4/D9; downgradient of the former underground mine goaf area which suggests that the elevated zinc concentrations are likely to be associated predominantly with the historical mine workings. The concentrations of zinc in groundwater in the western areas of the Site were less than a factor of two above the maximum reported background concentration.

*Summary*

Metals and metalloid concentrations in groundwater exceeded one or more of the adopted human health and/or ecological screening values in most monitoring wells across the Site. However, in the majority of monitoring wells metals and metalloid results fall within concentration ranges within a factor of two of the maximum concentrations seen in background monitoring wells.

Overall, groundwater monitoring wells with concentrations of metal(oids) equal to or above a factor of two of the maximum background concentrations were distributed in several key areas of the Site, including:

- in the main operation area, particularly between the coal storage area and the water holding ponds (MJ\_X\_MWMP6, MI\_X\_5/D8, MI\_X\_5/D5, MG\_X\_MP1, MK\_MW07 MI\_X\_5/D2, MK\_MW02, MK\_MW03, MK\_MW06). The groundwater in this area may be affected by backfilled former open cut mine workings and underground mine goaf areas that underlie the site;

- near a remnant mine spoil dump to the north east of the coal storage area (MG\_X\_4/D4, ML\_MW07). The sample taken from MG\_X\_4/D4 further had a significantly lower pH (pH 3.3) than the other monitoring wells affected by arsenic and it is probable that MG\_X\_4/D4 has been affected by leachate from the remnant mine spoil dump that may have undergone oxidation of sulfide material (resulting in the creation of acidic conditions) associated with mine spoil;
- downgradient of former underground mine goaf areas and the more recent former mine workings in Huons Gully, including the coal fines rejects (MH\_X\_D15, MG\_X\_4/D10, MH\_MW01, MG\_X\_4/D1, MG\_X\_4/D9 and MH\_MW03); and
- downgradient of the current ash repository and downgradient of former underground mine goaf areas and the more recent former mine workings in Huons Gully (MG\_X\_4/D1 and MG\_X\_4/D9).

### 5.5.2 *Groundwater Salinity Concentrations*

As discussed in *Section 5.4.7*, annual groundwater monitoring is undertaken in the vicinity of the ash repository. The results of previous groundwater monitoring have identified elevated boron and sulfate concentrations in the vicinity of the ash repository, as well as a marked increase in chloride concentrations in monitoring bore MPM4/D10 (MG\_X\_4/D10) (Aurecon, 2012). Whilst salinity, heavy metals and chloride are considered to be tracers for potential brine mobilisation from the ash repository, previous reports have identified sources of these impacts which are unrelated to the contributions from the ash repository. These other sources include historical coal mining operations and seepage from the coal washery rejects ponds within the former mine workings in Huons Gully.

Generally the field measurements of EC and laboratory analytical results for sodium and chloride were higher in most monitoring wells within the vicinity of the ash repository AECs (MG and MH) compared to other areas of the Site. The gauging data from the baseline ESA indicates an overall groundwater flow towards the north-east. EC readings of less than 1000  $\mu\text{S}/\text{cm}$  indicated that groundwater conditions were relatively fresh in wells up-gradient of the ash repository, on the northern perimeter (MG\_X\_MP1, MG\_X\_4/D4, MG\_X\_4/D5). Similar conditions were observed at monitoring well MH\_MW02 located within the recent former mine workings in Huons Gully but up-gradient of the identified coal fines rejects.

Comparatively higher EC readings (100-2000  $\mu\text{S}/\text{cm}$ ) and/or sodium (128-262 mg/L) and chloride (68-147 mg/L) concentrations in groundwater were reported at monitoring wells:

- within the coal fines rejects area in Huons Gully (MH\_X\_D15, MH\_MW01); and

- on the downgradient perimeter of the current ash repository and Lamberts North (MH\_X\_D19, MG\_X\_4/D1 and MG\_X\_4/D9).

The highest readings of EC and concentrations of sodium and chloride in groundwater in the baseline ESA were reported at MG\_X\_4/D10 and MH\_MW03. These wells are located on the southern perimeter of the current ash repository and are both downgradient of the former underground mine goaf areas and the more recent former mine workings in Huons Gully, including the coal fines rejects.

With the exception of MG\_X\_4/D10 and MH\_MW03 the concentrations of chloride and sodium in groundwater in the vicinity of the ash repository (AECs, MG and MH) were less than a factor of two of the maximum reported background concentration at ML\_MW05 and are therefore considered to be indicative of local background conditions.

Based on the available data, whilst there are elevated concentrations of sodium and chloride concentrations in the vicinity of MG\_X\_4/D10 and MH\_MW03, the groundwater quality on the down-gradient perimeter of the Site (based on groundwater sampling results from monitoring wells MH\_X\_D19, MG\_X\_4/D1 and MG\_X\_4/D9) is considered to be within the expected range for local background conditions.

Potential sources of the elevated sodium and chloride concentrations at MG\_X\_4/D10 and MH\_MW03 include contributions from the up-gradient underground mine goaf areas, and the coal fines rejects within the recent former mine workings in Huons Gully. Based on the available data the contribution of sodium and chloride from the former mining activities cannot be distinguished from potential contributions from the current ash repository.

## 5.6

### *DATA QUALITY*

The data presented in the ESA was considered to generally be of a suitable quality and completeness to provide a baseline of environmental conditions at the Site. Whilst some minor non-conformances have been identified in relation to field and laboratory QA/QC, these are not considered to have a material impact on the outcomes of this assessment.

A summary of the locations unable to be completed due to various reasons is provided in *Table 3.1*. In locations where soil bores could not be excavated to the target depth due to proximity to known or suspected sub-surface utilities, surface soil samples were collected using a hand trowel.

A discussion of the limitations and uncertainties associated with the investigation is included in *Section 3.5* and a discussion of the suitability of the data and the requirement for further investigation included in *Section 5.7.5*. The discussion of the CSM provided in the *Section 5.7.1* and *Section 5.7.2* and summarised in *Annex C* is based on the following assumptions:

- the understanding of the potential sources as detailed in *Section 5.4* and *Section 5.7.1*;
- potential receptors were identified in *Section 2.9* and *Section 5.7.1* based on publically available information; and
- potential exposure pathways to receptors are based on ongoing use of the Site as a Power Station in the same or similar configuration to that observed at the time of this assessment.

## 5.7 **OVERALL DISCUSSION**

The primary objective of this Phase 2 ESA was to develop a baseline assessment of environmental conditions at the site and within the immediate surrounding receiving environments at or near the time of the transaction. The results of the assessment have also been used to assess:

- The nature and extent of soil and/or groundwater impact on / beneath the Site and in relation to neighbouring sensitive receptors.
- Whether the impacts at the Site represent a risk to human health and/or the environment, based on the continuation of the current use.
- Whether the impact at the Site is likely to warrant notification /regulation under the *CLM Act 1997*.
- Whether material remediation is considered likely to be required.
- Whether the data collected during the assessment was of a suitable quality and completeness to provide a baseline of environmental conditions at the Site.

The overall results of the assessment are discussed herein, with reference to these objectives and the CSM. The CSM developed as part of the *SAQP* (ERM, 2013a) was revised to incorporate overall results of the assessment and is presented in the following *Sections 5.7.1 and 5.7.2* as well as graphically represented in *Annex C*.

### 5.7.1 **Summary - The Nature and Extent of Soil, Sediment, Groundwater and Surface Water Impact**

A CSM was developed and refined, which identified the following ecological and human receptors:

- onsite employees, including intrusive workers potentially labouring within shallow trenches/excavations;
- recreational users of Neubecks Creek, and Lake Lyell;

- terrestrial ecological receptors within the open space areas both on and surrounding the Site; and
- freshwater aquatic organisms within Lake Lyell, Thompsons Creek Reservoir, Neubecks Creek.

Soil, sediment, surface water and groundwater data were compared against published environmental quality levels to provide a screening level assessment of potential risks to these identified receptors. The findings of the screening process indicated that concentrations in soil, sediment, surface water and groundwater generally complied with the adopted screening values, with some exceptions as discussed in the following sections. Potential source-pathway-receptor linkages identified in the preliminary ESA were subsequently revised on the basis of the available data and the refinement of receptors, as discussed in *Section 5.6.2*.

#### *Onsite Soil*

- Copper, nickel and/or zinc were detected at concentrations in excess of the adopted ecological screening value for commercial/industrial sites in soil samples collected from MK (Operational Area) and ML (Buffer Lands and Former Contractors Yard).
- TRH was detected at concentrations in excess of the adopted ecological screening value for commercial/industrial sites in soil samples collected from MD\_MW04 and MK\_SB87.

#### *Onsite Groundwater*

- LNAPL was detected in three groundwater monitoring wells;
- Benzene was detected at concentrations in excess of the adopted human health (drinking water) screening values in groundwater samples collected from AECs MJ (Operational USTs).
- Metals and metalloid concentrations in groundwater exceeded one or more of the adopted human health and/or ecological screening values in most monitoring wells across the Site. Where metals were above background concentrations, impact generally appears to be related to contributions from former mine workings both on the Site and in surrounding areas.
- Overall, groundwater monitoring wells with concentrations of metal(oids) equal to or above a factor of two of the maximum background concentrations were distributed in several key areas of the Site, including:
- in the main operation area, particularly between the coal storage area and the water holding ponds (MJ\_X\_MWMP6, MI\_X\_5/D8, MI\_X\_5/D5, MG\_X\_MP1, MK\_MW07 MI\_X\_5/D2, MK\_MW02, MK\_MW03, MK\_MW06). The groundwater in this area may be affected by backfilled

former open cut mine workings and underground mine goaf areas that underlie the site;

- near a remnant mine spoil dump to the north east of the coal storage area (MG\_X\_4/D4, ML\_MW07). The sample taken from MG\_X\_4/D4 further had a significantly lower pH (pH 3.3) than the other monitoring wells affected by arsenic and it is probable that MG\_X\_4/D4 has been affected by leachate from the remnant mine spoil dump that may have undergone oxidation of sulfide material (resulting in the creation of acidic conditions) associated with mine spoil;
- downgradient of former underground mine goaf areas and the more recent former mine workings in Huons Gully, including the coal fines rejects (MH\_X\_D15, MG\_X\_4/D10, MH\_MW01, MG\_X\_4/D1, MG\_X\_4/D9 and MH\_MW03); and
- downgradient of the current ash repository and downgradient of former underground mine goaf areas and the more recent former mine workings in Huons Gully (MG\_X\_4/D1 and MG\_X\_4/D9).

#### *Onsite Sediments*

- Copper, nickel and zinc concentrations exceeded the ISQG-Low in one sample from Lake Lyell; however all concentrations were below the ISQG-High.
- Copper and lead concentrations exceeded the ISQG-Low in one sample from Thompsons Creek Reservoir; however all concentrations were below the ISQG-High.
- There were no applicable Australian screening values identified for TRH in sediment in fresh water environments. It was noted that one sample from Lake Lyell marginally exceeded the adopted screening value, however the adopted screening level is applicable to marine environments.

#### *Onsite Surface Water*

- Concentrations of metals in surface water in Lake Lyell and Thompsons Creek Reservoir were below the adopted human health (drinking water and recreational) screening values in all samples.
- Concentrations of metals in surface water in Lake Lyell and Thompsons Creek Reservoir were below the adopted ecological screening values, with the exception of zinc and copper.
- Copper concentrations in surface water in Lake Lyell and Thompsons Creek Reservoir marginally exceeded the ecological screening values in the majority of surface water samples analysed. The prevalence of copper in all samples marginally above the adopted ecological criteria indicates that the

concentrations are likely attributable to local background conditions in the catchment.

- Zinc concentrations in surface water marginally exceeded the ecological screening values in one sample from in Lake Lyell and one sample from Thompsons Creek Reservoir. This is likely attributable to local background conditions in the catchment, including discharges from Cox River and Farmers Creek.

#### *General Observations*

LNAPL was observed at three sampling locations within Area ME (Mobile Plant Refuelling Area).

Asbestos fibres were not detected within any soil samples analysed at the Site. It is however noted that the vertical boring of soils is not an ideal method via which to identify asbestos impacts in soils. The absence of asbestos within fill materials or upon surface soils in other areas across the Site therefore cannot be guaranteed on the basis of the results of this assessment. Similarly, as with any investigation of this nature, the potential exists for unidentified contamination to exist between the completed sampling locations both within and between AECs.

#### 5.7.2

#### *Summary – Does the Identified Impact Represent a Risk to Human Health and/or the Environment?*

The approach to the screening of the data gathered in this assessment was to initially adopt the most conservative potential assessment values to consider all potential receptors identified in the CSM (*Annex C*). The exceedences of the screening values outlined in *Section 3.5.2* were subsequently assessed on a case by case basis, in light of the specific characteristics of the individual samples and the AEC from which those samples were collected. The conclusions of these further assessments were incorporated into the CSM as presented in the following sections and summarised in *Annex C*. Potential source-pathway-receptor linkages identified in the preliminary ESA were subsequently revised on the basis of the available data and the refinement of receptors.

#### *Onsite Soil*

The soil results from all AECs at the Site comply with the applicable human health and ecological criteria for the current and on-going land-use with some minor exceptions as outlined below.

Copper, nickel and/or zinc were detected at concentrations in excess of the EIL for commercial/industrial sites in soil samples collected from AECs MK (Operational Area) and ML (Buffer Lands and Former Contractors Yard).

Copper was detected above the adopted EIL in AEC MK at one location, MK\_SB33 at a depth of 1.5 m bgl. Statistical assessment of copper concentrations in soils within AEC MK demonstrated that this exceedence is a localised hotspot, and is unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a power station.

The copper and nickel concentrations at ML\_SB36 were >250% of the ecological screening criteria. Red sand was present at the surface at ML\_SB36, extending from a nearby workshop building and covering an area of approximately 100 m<sup>2</sup>. The depth of the red sand is anticipated to be < 0.3 m bgl, based on the depth to bedrock (shale) encountered at ML\_MW20 to the north. This sand is likely a product of grit blasting on open ground from historical operations relating to Site construction activities.

Current Site practices should be reviewed to ensure that such activities are currently carried out in appropriate areas where waste products can be managed accordingly.

Shale bedrock outcrops were observed at the surface in this area, with shallow soils typically less than 0.5 m bgl in this area. There is limited soil to support plant growth, and it is unlikely to represent an area of high ecological significance. These impacts are considered unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a Power Station.

It is recommended that the red sand visible in the area to the south of the workshop building be removed from this area as part of general housekeeping.

Total Recoverable Hydrocarbons in the C10-C16 fraction were detected at a concentration in excess of the ESL for commercial/industrial sites in a soil sample collected from MK\_SB87 at a depth of 1.0 m bgl, associated with an odour and an elevated PID reading. The measured concentration of TRH in the deeper soil sample collected at 3 m bgl was below the laboratory LOR and TRH concentrations were below the laboratory LOR in groundwater samples from this area (MK\_SB87/MK\_MW04).

Operational activities in this area include an ash washdown pit, miscellaneous pumps and the day maintenance building. Sub-surface infrastructure in this area includes stormwater, contaminated waste water and ash washwater drainage pipes. It is recommended that the integrity of the contaminated waste water drainage pipes be inspected to assess the potential for further impact. It was noted that vegetation in this area is limited to grass on landscaped areas. Grasses have a shallow root zone and impacts at a depth of 1.0 m bgl are therefore considered unlikely to represent a significant risk to the terrestrial environment under the ongoing use of the Site as a power station.

Total Recoverable Hydrocarbons in the C10-C16 fraction and C16-C34 fractions were detected at a concentration in excess of the ESL for commercial/industrial sites in a soil sample collected from 1.2 m bgl at MD\_MW04. The hydrocarbon impacts identified at this location may be related to historical leaks or spills associated with workshop activities in this area. Area MD is largely covered in concrete hardstanding, with some grass areas around service easements. Area MD is not considered to have any significant ecological value and thus the application of the ESLs is considered to be overly conservative in this instance.

Based on the discussion provided herein, it is considered that whilst exceedences of the ecological screening levels in soils were identified, the relevant source-pathway-receptor linkages are incomplete.

### ***On-site Groundwater***

#### *Sensitivity of Receiving Environments*

Groundwater beneath the Site is not extracted for potable use and a search of licensed groundwater bores has not identified any potential groundwater abstraction receptors in the vicinity of the Site. The highly disturbed nature of the region through coal mining reduces the potential for the potable or domestic use of groundwater in the vicinity of the Site to be approved in the future.

The groundwater beneath the Site could be considered to be an aquatic environment of significance. However, as discussed in *Section 5.5*, the regional groundwater has elevated concentrations of heavy metals which originate from the characteristics of the local geology, and also have been degraded by historical mining activities.

Based on the topography and available hydrological information, groundwater beneath the Site is considered to ultimately discharge to Neubecks Creek, a tributary of the Coxs River. The volume of flow in the upper reaches of Neubecks Creek adjacent to the Site are noted to be intermittent, with typically low volumes of flow of <1ML/day (BOM, 2014). It is further noted that groundwater may not be a major contributor to surface water in Neubecks Creek, as the connection between the groundwater on the Site and Neubecks Creek may not be complete. Reaches of Neubecks Creek have been defined as “losing” streams, whereby the base level of the creek is above the level of groundwater aquifer (R.W. Corkery & Co., 2010). It is important to note that the only direct discharges to surface water from the Site are stormwater drainage discharged from a holding pond at LDP1 on Neubecks Creek which is managed and regulated under the EPL.

The quality of the Coxs River catchment has been degraded by industrial activities in the broader catchment, including coal mining, mine discharges, sewage treatment, and the operation of two power stations (Mt Piper and Wallerawang further downstream) (Birch et al, 1999).

The Coxs River discharges into Lake Wallace, downstream of the Wallerawang Power Station. The quality of the surface water and sediments in Lake Wallace are discussed in *Project Symphony – Wallerawang Phase 2 Environmental Site Assessment* (ERM, 2014), and as such are not considered further here. In a study of sediments on the Coxs River catchment, Birch et al (1999) concluded that Lake Wallace impedes the migration of a large proportion of heavy metals, reducing the amounts of heavy metals entering Lake Burragorang, the main drinking water reservoir for Sydney.

The ANZECC (2000) *freshwater ecological trigger values* were adopted in this assessment adopted to evaluate the requirement to report groundwater contamination across the Site, in accordance with the DECC (2009) *Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997* (refer to Section 5.7.3). However, it is noted that due to the degraded quality of the background groundwater and the receiving surface waters the adoption of a lower threshold of protection of species may be appropriate. As set out in the ANZECC (2000) guidelines however, the adoption of a lower level of should only be undertaken following consultation with relevant stakeholders and may also require more detailed assessment of potential toxicity, hence the 95% and 99% guidelines (for potential bioaccumulation of mercury and selenium) are considered the most appropriate for initial screening purposes in this assessment.

The NHMRC (2008) recreational screening values were adopted in this assessment adopted to evaluate potential risks to recreational users of Neubecks Creek, Coxs River, and Lake Wallace further downstream. There are no known recreational users of Neubecks Creek and the upper reaches of the Coxs River, however as public access cannot be precluded, these receptors have been considered for the purpose of this assessment.

The NHMRC (2013) drinking water screening values were also adopted to evaluate the requirement to report groundwater contamination across the Site, in accordance with the DECC (2009) *Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997* (refer to Section 5.7.3).

### ***Hydrocarbons in Groundwater***

#### *Potential Sources*

As discussed in Section 5.4.10, benzene was detected at concentrations in excess of the adopted human health (drinking water) screening values in groundwater samples collected from AEC MJ (Operational USTs). It is noted that this is an existing well. The benzene exceedence at this location is attributable to the UST and associated fuel lines or possible surface spills. It is recommended that the integrity of the UST and lines in this location be tested to confirm the absence of sub-surface leaks.

As groundwater in the vicinity of the Site is not extracted for drinking water, the presence of benzene in excess of the adopted human health (drinking water) screening values is not considered to represent a significant risk to the humans under the ongoing use of the Site as a power station.

ERM understands that the current site operator (Energy Australia) (and prior to the transaction Delta Electricity) has been developing appropriate management approaches in relation to this issue alongside independent consultants and regulators. It is noted that Delta Electricity has previously notified this issue to NSW EPA. It is considered that the costs for management of this issue may be potentially material depending on the remediation / management option selected.

As discussed in *Section 5.4.5*, LNAPL was detected in three groundwater monitoring wells in Area ME. There have been no reported surface spills and integrity tests of the current UST near ME\_X\_MW7 have not identified any issues. The source of the LNAPL has not been definitively identified, and other underground infrastructure in this area has not been investigated to-date. The oil-water separator drains through an underground pipe in a north-easterly direction, discharging into an open surface water drain along the coal storage area boundary. The bobcat pit drains to an oil collection pit which is pumped out by a road tanker.

Groundwater flow direction across the Site is typically to the north-east, as indicated in *Figure 6.1, Annex A*. In the AEC ME, groundwater flow direction appears to be mounded in the area of ME\_X\_MWMP8, adjacent to the oil-water interceptor, as shown in *Figure 6.3, Annex A*.

Aside from an unknown historical surface spill, on-going leaks in underground infrastructure in the vicinity, including the bobcat pit, the oil-water separator or the drainage pipe from the oil-water interceptor are potential sources of contamination. Both the sewer main and the oil-water interceptor drainage pipe cross through the area of the LNAPL plume, and the service trenches around these pipes are considered potential preferential pathways for migration of contaminants.

#### *Human Receptors – Exposure Pathways (Dermal, Ingestion, Inhalation)*

Groundwater beneath the Site is not extracted for potable use and a search of licensed groundwater bores has not identified any potential groundwater abstraction receptors in the vicinity of the Site. Groundwater is present at depths greater than 3.5 m bgl, therefore there are no feasible direct contact exposure pathways (ingestion and/or dermal absorption) for human receptors to encounter LNAPL and/or potential dissolved phase hydrocarbons. Based on the available information this source-pathway-receptor linkage has been discounted.

There may be a risk to workers on-site from vapour intrusion inside the workshop buildings if the LNAPL plume extends beneath the building. There

may also be a risk to intrusive maintenance workers from vapours when conducting excavation works in trenches for sub-surface utility maintenance or future construction; however it is noted that normal trench excavation is unlikely to encounter LNAPL present at depths of greater than 3.5 m bgl.

Vapour intrusion risks are considered to be unlikely given the current use of this area, however cannot be discounted on the basis of the current data. It is noted that the workshop buildings are well ventilated with roller door access and typically open to the outdoors. A potentially complete source-pathway-receptor linkage does however remain in relation to potential inhalation exposure for industrial workers and/or intrusive maintenance workers.

On the basis of the current data, the down-gradient extent of the plume appears to have been delineated to the south of the coal stockpile area, with a down-gradient monitoring well ME\_X\_MW06 located approximately 12 m to the north of ME\_X\_MW03.

However, it is noted that the existing monitoring wells in this area (including recently installed wells by SMEC) are not screened consistently, with groundwater intercepted in two different lithologies. LNAPL has been identified in monitoring wells screened in fill materials at depths of 3-6 m bgl at ME\_X\_MWMP7, and 1-4 m bgl at ME\_X\_MWMP8. LNAPL has also been identified in monitoring well ME\_X\_MWMP12 screened in sandstone, at a depth of 4-7 m bgl.

#### *Ecological Exposure Pathways*

On the basis of the current data, and the distance to the downgradient Site boundary being more than 750 m to the north-east, it is unlikely that the LNAPL plume will foreseeably impact on the closest ecological receptor, Neubecks Creek, located on the north-east boundary of the Site.

#### *Metals in Groundwater*

##### *Potential Sources*

Monitoring wells across the Site reported concentrations of a wide range of metals at concentrations exceeding the adopted human health and / or ecological screening values as discussed in *Section 5.5*.

The regional groundwater has elevated concentrations of heavy metals which originate from the characteristics of the local geology, and also have been degraded by historical mining activities. The concentrations of metals in groundwater across the Site are generally comparable to up-gradient background monitoring wells. Where metals are above background concentrations, the impacts appear to be associated with contributions from former mine workings both on the Site and in surrounding areas.

The contribution of the ash repository to metals concentrations in groundwater cannot be differentiated from the contribution of the former

mine workings. However, it is noted that the concentrations of most metals in groundwater downgradient of the current ash repository (MG\_X\_4/D1 and MG\_X\_4/D9) is within a similar range to monitoring wells in the former Huons Gully downgradient of the underground mine goaf (MH\_MW01, MH\_MW03, MH\_X\_D15, MH\_X\_D19). It is further noted that the contribution of the current ash repository to metals concentrations in groundwater was considered in the approval for the Mt Piper Ash Placement Project, which was approved by the Minister for Planning and Infrastructure under the *Environmental Planning and Assessment Act 1979* (NSW), and measures were implemented to minimise potential additional metals loadings from the current ash repository, and the extension into Lamberts North.

#### *Human Exposure Pathways*

Based on the available information potential source-pathway-receptor linkages have been discounted. In summary, the CSM was revised to consider the following source-pathway-receptor linkages:

- Ingestion - groundwater in the vicinity of the Site is not extracted for drinking water.
- Dermal absorption - direct contact with groundwater is unlikely based on the depth to groundwater and the on-going operations at the Site. Based on the available information this source-pathway-receptor linkage has been discounted.
- Inhalation - there are no potential inhalation exposure risks associated with metals in groundwater. Based on the available information this source-pathway-receptor linkage has been discounted.
- Ecological exposure pathways

The significance of potential impacts to ecological receptors in both groundwater and surface water is unclear, given the degraded quality of background groundwater and surface water and the undetermined connection of groundwater to Neubecks Creek. Given that potential groundwater discharges to Neubecks Creek occur up-stream of a highly disturbed catchment, including mine discharges (under existing EPLs) downstream of the confluence with the Coxs River, and licenced discharges from Wallerawang Power Station, the cumulative impact of these off-site sources to ecological receptors must be considered.

The quality of groundwater in the vicinity of the current ash repository and Lamberts North have been considered by several regulatory agencies (including the Sydney Catchment Authority and NSW Office of Water) in the approval for the Mt Piper Ash Placement Project, which was approved by the Minister for Planning and Infrastructure under the *Environmental Planning and Assessment Act 1979* (NSW). Further consultation with the appropriate regulatory agencies, including NSW EPA, is recommended to assess the

appropriate management of this issue under the CLM Act (1997) and/or the *POEO Act* (1997).

### 5.7.3 *Summary – Does the Impact Warrant Notification under the Contaminated Land Management Act 1997?*

Under section 60 of the *CLM Act 1997*, a person whose activities have contaminated land or a landowner whose land has been contaminated is required to notify NSW EPA when they become aware of the contamination. The DECC (2009) *Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997*, state that a landowner or a person whose activities have contaminated land is required to notify NSW EPA that the land is contaminated if;

- the level of the contaminant exceeds the appropriate published screening level with respect to a current or approved use of the land, **and** people have been, or foreseeably will be, exposed to the contaminant; or
- the contamination meets a specific criterion prescribed by the regulations; or
- the contaminant has entered, or will foreseeably enter, neighbouring land, the atmosphere, groundwater or surface water, **and** the contamination exceeds, or will foreseeably exceed, an appropriate published screening value and will foreseeably continue to remain above that level.

The soil and groundwater results obtained in this assessment have been compared against the screening values specified in NSW DECC (2009) *Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997* and a number of exceedences have been identified.

Every exceedence of these screening values is not, however, required to be reported to the NSW EPA. If the exceedence is representative of background conditions; or offsite migration of contamination to an adjoining property has not occurred **and** any onsite contamination has been adequately addressed under the Environmental Planning and Assessment Act then reporting under the CLM Act is not required. Further to this, in the case of onsite soil contamination, if no plausible exposure pathway to people or the environment is present, reporting is also not required.

On the basis of the discussions outlined in *Section 5.6.2*, the constituents that have been identified in onsite soil, sediment, surface water and groundwater are generally not exceeding the relevant screening values as cited in NSW DECC (2009).

The identified impacts which do exceed the relevant screening values and are considered to warrant further consideration with regards to whether a duty to report may exist under the CLM Act include the following:

- LNAPL detected in groundwater in Area ME, which has previously been reported to NSW EPA under the CLM Act;
- benzene was detected at a concentration in excess of the adopted human health (drinking water) screening values in groundwater at MJ\_X\_MWMP1;
- heavy metals in groundwater detected at concentrations not attributable to natural background conditions in groundwater at various locations across the Site.

Each of these issues is discussed in further detail below.

#### *LNAPL In Groundwater - AEC ME*

LNAPL was detected in two groundwater monitoring wells on the northern side of the wash bay, adjacent to the oil-water separator (ME\_X\_MWMP8 and ME\_MW03), and one monitoring well on the southern side of the wash bay, adjacent to the diesel UST and bowser (ME\_X\_MWMP7).

LNAPL was previously identified in one groundwater monitoring well (ME\_X\_MWMP8) in October 2012 (SMEC 2012). Subsequent fingerprinting analysis of the LNAPL identified this is most likely weathered diesel with an estimated age of 25 years (+/- 5 years). Based on the age of the weathered diesel, and the findings of the tank integrity tests for the diesel UST near ME\_X\_MWMP7 it was concluded that the LNAPL was related to an historical spill and not an underground release from the current UST.

The source of the LNAPL has not been definitively identified, and other underground infrastructure in this area has not been investigated to-date. The oil-water separator drains through an underground pipe in a north-easterly direction, discharging into an open surface water drain along the coal storage area boundary. The bobcat pit drains to an oil collection pit which is pumped out by a road tanker.

Aside from an unknown historical surface spill, on-going leaks in underground infrastructure in the vicinity, including the bobcat pit, the oil-water separator or the drainage pipe from the oil-water interceptor are potential sources of contamination.

Both the sewer main and the oil-water interceptor drainage pipe cross through the area of the LNAPL plume, and the service trenches around these pipes are potential preferential pathways for migration of contaminants.

Delta Electricity has previously reported the presence of LNAPL to NSW EPA in compliance with the requirements of the *Protection of the Environment Operations (Underground Petroleum Storage Systems) Regulation 2008 (NSW)*. Concurrent investigations were undertaken by SMEC on behalf of Energy Australia in November 2013, and routine monitoring is undertaken in compliance with the *POEO (UPSS) Regulation 2008*.

Notification to NSW EPA has already been initiated by Delta Electricity/EnergyAustralia, and it is recommended that this additional information is communicated to NSW EPA by EnergyAustralia. It would be prudent to undertake an additional round of confirmatory groundwater sampling at the cross-gradient locations near ME\_X\_MWMP8, to confirm the delineation of LNAPL prior to reporting to NSW EPA. This may already be scheduled as part of the existing scheduled UPSS monitoring program.

#### *Benzene in Groundwater AEC MJ*

Benzene was detected at a concentration marginally above the adopted human health (drinking water) screening values in groundwater at MJ\_X\_MWMP1 adjacent to a UST and fuel bowsers. Given that the detection within of benzene AEC MJ (MJ\_X\_MWMP1) was only marginally above the screening value, it is suggested that an additional round of confirmatory sampling be undertaken to confirm these results and assess the likelihood that the detected concentration will foreseeably remain above the human health (drinking water) screening value.

It is however considered unlikely in ERM's opinion that these impacts would be considered significant enough to warrant regulation by the NSW EPA given the absence of groundwater use on-site, it's already degraded nature and the proximity of the result to the screening value.

#### *Metals in Groundwater*

Various metals were detected at concentrations above the human health (drinking water) and / or ecological screening values which were not attributable to background conditions in groundwater at a number of locations across the Site. The concentrations of metals in groundwater across the Site are generally comparable to up-gradient background monitoring wells. Where metals are above background concentrations, impact generally appears to be associated with former mine workings both on the Site and in surrounding areas.

The contribution of the ash repository to metals concentrations in groundwater cannot be differentiated from the contribution of the former mine workings. However, it is noted that the concentrations of most metals in groundwater downgradient of the current ash repository (MG\_X\_4/D1 and MG\_X\_4/D9) lie within a similar range to concentrations in monitoring wells in the former Huons Gully, downgradient of the underground mine goaf (MH\_MW01, MH\_MW03, MH\_X\_D15, MH\_X\_D19). It is further noted that the contribution of the current ash repository to metals concentrations in groundwater was considered in the approval for the Mt Piper Ash Placement Project, which was approved by the Minister for Planning and Infrastructure under the *Environmental Planning and Assessment Act 1979* (NSW), and

measures were implemented to minimise potential additional metals loadings from the current ash repository, and the extension into Lamberts North.

A summary of metals exceeding screening values with regard to the duty to report is provided in *Table 5.16* (over).

Table 5.16 Groundwater Screening in Relation to Potential Duty to Report

Metal	Data Range (µg/L)	Data Average (µg/L)	Background* Maximum (µg/L) Site/Ash	WMP ANZECC (2000) Modified^	Exceedences of Human Health (Drinking Water) or Ecological Screening Value	Relevant AECs #
Arsenic	0.4 - 129	8	10	24	Yes, ecological, drinking water and recreational value exceeded. Arsenic concentrations were above a factor of two of the maximum reported background concentration in five monitoring wells, four (MC_MW04, MC_MW04, MJ_X_MWMP5 and MK_MW11) of which are located in the eastern area of the main operation area at the Power Station, and one monitoring well (MG_X_4/D4) located to the north east of the coal storage area and directly down-gradient of a remnant mine spoil dump. These five monitoring wells with exceedences higher than background in particular may warrant reporting.	MC, MG MJ, MK ML
Boron	16 - 4150	198	<50 (289)	370	Yes, ecological and drinking water value exceeded. Boron concentrations in monitoring wells MG_X_4/D1, MG_X_4/D9, MG_X_4/D10 and MH_MW03 were between a factor of seven and more than an order of magnitude above the maximum concentration reported for the Ash Repository Background Monitoring Wells. It should be noted that the majority of the noted exceedences are in the vicinity of the Ash Repository which is regulated under the Site EPL.	MG, MH
Cadmium	<0.05 - 7.4	0.37	0.5	1	Yes, both ecological and drinking water were exceeded. Reported concentrations a factor of two above the maximum reported background concentration were limited to four monitoring wells; MG_X_4/D4 located to the north east of the coal storage area and directly down-gradient of a remnant mine spoil dump, MG_X_MP1 located upgradient of the current ash repository, MG_X_4/D10 located down-gradient of both the underground mine goaf and the current ash repository, and MH_X_D15 located adjacent to the underground mine goaf. These four monitoring wells with exceedences higher than background in particular may warrant reporting.	MG, MH, ML
Chromium	<0.2-10	0.58	na	1	Yes, ecological value marginally exceeded in three locations.	MD, MG, MH
Copper	0.5-39.4	3.1	2	2.5	Yes, ecological value exceeded. Reported concentrations a factor of two above the maximum reported background concentration were limited to ten monitoring wells located in the water holding pond area, operational ASTs area, the main operational area of the Power Station, non-operational areas and the current ash repository. The results indicate that the presence of copper impact above background concentrations are relatively localised on site within distinct areas, and that the current ash repository is not a significant source of copper to groundwater given that the highest copper concentration was reported for monitoring well MG_X_MP1 located upgradient of the current ash repository. These ten monitoring wells with exceedences higher than background in particular may warrant reporting.	MF, MG, MH, MI, MK, ML
Lead	<0.1-47	3.3	13	5	Yes, both ecological and drinking water values were exceeded. Reported concentrations a factor of two above the maximum reported background concentration were limited to three monitoring wells located in the electrical transformers area, the operational area and to the north east of the coal storage area and	MC, MK, ML

COMMERCIAL IN CONFIDENCE

Metal	Data Range (µg/L)	Data Average (µg/L)	Background* Maximum (µg/L) Site/Ash	WMP ANZECC (2000) Modified^	Exceedences of Human Health (Drinking Water) or Ecological Screening Value	Relevant AECs #
					directly downgradient of a remnant mine spoil dump (MG_X_4/D4). The results indicate that the presence of lead impact above background concentrations are highly localised in distinct areas on site, and that the current ash repository is not a significant source of lead to groundwater. These three monitoring wells with exceedences higher than background in particular may warrant reporting.	
Manganese	50-20,300	4420	9870	1900	Yes, ecological, drinking water and recreational value exceeded. Reported concentrations a factor of two above the maximum reported background concentration were limited to one monitoring well (MI_X_5/D5) located directly downgradient of a wastewater pond. The results therefore indicate that the presence of manganese impact above background concentrations is limited to a highly localised part of the water holding pond area. Monitoring wells MI_X_5/D5 with exceedence higher than background in particular may warrant reporting.	MI
Nickel	2-990	152	82 (172)	17	Yes, both ecological and drinking water values were exceeded. Reported concentrations a factor of two above the maximum reported background concentration were limited to three monitoring wells located at the water storage ponds (MI_X_5/D2, MK_MW03, MK_MW06), one in the main operational area at the Power Station (MK_MW02) and a further seven monitoring wells located downgradient of the underground mine goaf and the current ash repository. The monitoring wells downgradient of the underground mine goaf and the current ash repository had reported concentrations above a factor of two of the maximum reported concentration for the Ash Repository Background Monitoring Wells (MG_X_4/D1, MG_X_4/D10, MG_X_4/D9, MH_MW01, MH_MW03, MH_X_D15, MH_X_D19). These eleven monitoring wells with exceedences higher than background in particular may warrant reporting.	MG, MH, MI, MK,
Zinc	<5 - 2300	176	56 (427)	116	Yes, ecological water values were exceeded. Reported concentrations a factor of two above the maximum reported background concentration included samples taken from 18 monitoring wells spread across the site, including the water holding pond area, operational ASTs area, the main operational area of the Power Station, the coal storage area (MB_MW02, MB_MW03, MB_MW05, MF_MW03, MG_X_4/D4, MI_X_5/D2, MK_MW02, MK_MW03, MK_MW09, MK_MW11, ML_MW08). Monitoring wells exceeding the maximum reported concentration for the Ash Repository Background Monitoring Wells included MG_X_MP1 MG_X_4/D10, MH_MW01, MH_MW03, MH_X_4/D8, MH_X_D15 and MH_X_D19. These 18 monitoring wells with exceedences higher than background in particular may warrant reporting.	MB, MF, MG, MH, MI, MK, ML

Notes: \* = Background values assessed as concentrations a factor of two above the maximum reported concentration in a background monitoring well.  
^ Connell Wagner (2008). Mt Piper Power Station Brine Conditioned Fly ash Co-placement Extension Water Management and Monitoring Plan. Delta Electricity Western. May 2008.  
# = AECs with concentrations above background values where background values exceed one or more of the screening values.

Whilst many of the metals exceedences can be related to background concentrations, some elevated concentrations appear to be related to contributions from former mine workings both on the Site and in surrounding areas.

Groundwater impacts related to activities undertaken within the ash repository (including the extension to Lamberts North) are already regulated and monitored under the Site EPL. It is noted that the construction of the Lamberts North Ash Repository was approved by the Minister for Planning and Infrastructure under the *Environmental Planning and Assessment Act 1979* (NSW).

In ERM's professional experience it is NSW EPA's preference to regulate issues such as these under either the *POEO Act (1997)* or the *CLM Act (1997)* rather than both, and, in the case of licensed premises, it is usually the *POEO Act (1997)* which is preferred.

Groundwater impacts above background conditions within the main operational areas of the Site, and on the down-gradient boundary can be attributed to contributions from former mine workings both on the Site and in surrounding areas. In this instance, groundwater impacts are not currently regulated under the Site EPL, however it is noted that any potential discharge to surface water in Neubecks Creek would occur up-stream of potential discharges from groundwater beneath the ash repository. Therefore, ERM therefore considers that NSW EPA would most likely continue to manage this issue under the *POEO Act (1997)* via the Site EPL (including the existing groundwater and surface water monitoring program), and hence would not require formal notification under the CLM Act, however this approach should be confirmed with NSW EPA to ensure strict adherence to the NSW DECC (2009) guidelines. Some modification to the existing groundwater and surface water monitoring program under the EPL may be required.

#### 5.7.4 ***Summary – Is Material Remediation or Management Likely to be Required?***

Based on the results of this assessment, the issues where potentially material remediation or management on a per source basis is likely to be required relate to the LNAPL identified in groundwater at the Mobile Plant Refuelling Area (ME). This issue was identified by Delta Electricity previous to this assessment, and has been officially notified to NSW EPA under Section 60 of the CLM Act. Further investigations into the extent of the LNAPL plume were conducted by Energy Australia concurrent to this investigation.

Further assessment and remediation may be required to address the hydrocarbon impacts in the mobile plant refuelling area (AEC ME). It is possible that costs related to this work could exceed the material threshold. As further assessment of the source of the LNAPL, and further delineation of the extent of contamination is required, detailed costings for remediation have not been prepared based the current data.

The costs associated with the management and/or remediation of this issue have been estimated in the range of \$M 0.3 - \$M 0.8 based on ERM's professional judgement and experience of similar hydrocarbon issues on large industrial sites.

It is recommended that the grit blasting impacts in the former contractors yard (Area ML) to the south of the workshop building be removed from this area as part of general housekeeping. The costs associated with this issue are not anticipated to be material.

As discussed in *Section 5.6.3*, the exceedences of the adopted screening values for metals in groundwater would most likely continue to be managed by NSW EPA under the *POEO Act (1997)* via the Site EPL. Therefore, ERM considers that the costs associated with this issue are not anticipated to be material.

The data presented in the ESA was considered to generally be of a suitable quality and completeness to meet the objectives as stated in *Section 1.2*, including to inform future decisions on the management of contamination issues. It is noted that the costs associated with the management and/or remediation of the identified contamination issues described above are indicative and that further assessment may be required to delineate the extent of contamination which may require management and/or remediation.

#### 5.7.5

#### ***Summary - Is The Data Suitable To Provide A Baseline Of Environmental Conditions At The Site And Immediate Surrounding Receiving Environments***

The data presented in the ESA was considered to generally be of a suitable quality and completeness to provide a baseline of environmental conditions at the Site as at or near the time of the transaction. It is noted that the majority of the locations proposed in the Preliminary ESA were able to be advanced, with the exception of the locations listed in *Table 3.1*.

It is noted that the vertical boring of soils is not an ideal method via which to identify asbestos impacts in soils. The absence of asbestos within fill materials or upon surface soils in other areas across the Site therefore cannot be guaranteed on the basis of the results of this assessment. Similarly, as with any investigation of this nature, the potential exists for unidentified contamination to exist between the completed sampling locations both within and between AECs.

Additional characterisation of the baseline conditions at the Site is not considered to be required on the basis of the outcomes of this investigation. It is noted that groundwater impacts associated with Underground Petroleum Storage System (UPSS) infrastructure at the Site were identified independently of this assessment and the current site operator (EnergyAustralia) has been developing appropriate management approaches alongside independent consultants and regulators. On the basis of the outcomes of this Phase 2 ESA, it is considered that further monitoring may be required in these areas as follows:

- Groundwater – It is recommended that the integrity of the UST and lines in the vicinity of MJ\_X\_MWMP1 be tested to assess the potential for sub-surface leaks. Additional confirmatory groundwater sampling is also recommended at this location to confirm the measured concentrations of benzene with specific reference to clarification of the duty to report contamination under *Section 60 of the CLM Act (1997)*.
- Groundwater – Additional groundwater monitoring and gauging in AEC ME (Mobile Plant Refuelling Area) is recommended at the cross-gradient locations near ME\_X\_MWMP8, to confirm the delineation of LNAPL prior to reporting of the most recent results to NSW EPA. This may already be scheduled as part of the existing scheduled UPSS monitoring program and/or separate investigations initiated by Energy Australia. It is recommended that the integrity of the oil pit and the adjacent oil-water interceptor in AEC ME is tested to investigate the potential source of LNAPL contamination in this area. It is further recommended that the sewer main and the drainage pipe from the oil-water interceptor be investigated to determine the potential for preferential migration pathways of LNAPL in this area.

**CONCLUSIONS**

ERM completed a Phase 2 ESA at Mt Piper Power Station in order to develop a baseline assessment of environmental conditions at the Site as at or near the time of the transaction. Soil, groundwater, surface water and sediment data were compared against published environmental quality levels to provide a screening level assessment of potential risks to identified human and environmental receptors. The following conclusions were made based on the data collected during the investigation:

- The impacts identified in soil and groundwater at the sites are unlikely to represent a risk to human health and/or the environment given appropriate ongoing management based on the current and continued use of the Site as a Power Station.
- The key impacts identified include hydrocarbons and LNAPL in groundwater in the Mobile Plant Refuelling Area, benzene in groundwater near a UST, and metals in groundwater (refer below).
- Various metals were identified at concentrations in excess of screening values across the Site, however the concentrations of metals in groundwater across the Site are generally comparable to background groundwater quality. Where metals were above background concentrations, impact generally appears to be related to contributions from former mine workings both on the Site and in surrounding areas.
- No contamination issues were identified which would require material management or remediation based on the current and continued use of the Site as a Power Station with the potential exception of the identified hydrocarbon impacts in groundwater in the Mobile Plant Refuelling Area. On the basis of the data available to ERM at the time of this assessment, the potential for vapour inhalation risks to industrial workers and/or intrusive maintenance workers in this area could not be ruled out. However, ERM understands that the current site operator (Energy Australia) (and prior to the transaction Delta Electricity) has been developing appropriate management approaches in relation to this issue alongside independent consultants and regulators. It is noted that Delta Electricity has previously notified this issue to NSW EPA. It is considered that the costs for management of this issue may be potentially material depending on the remediation / management option selected.
- ERM considers that NSW EPA would most likely continue to manage the LNAPL issue under the existing notification of potential contamination under the CLM Act, however, the additional results should be provided to NSW EPA for review and consideration.

- ERM considers that NSW EPA would most likely continue to manage the metals in groundwater issue under the *POEO Act (1997)* via the Site EPL (including the existing groundwater and surface water monitoring and reporting required as part of the conditions of consent issued under the *EP&A Act*), and hence would not require formal notification under the *CLM Act (1997)*, however this approach should be confirmed with NSW EPA to ensure strict adherence to the *NSW DECC (2009)* guidelines. It is noted that NSW EPA could potentially request some modifications to the existing groundwater and surface water monitoring program under the EPL.
- The data presented in this Phase 2 ESA was generally considered to be of a suitable quality and completeness to provide a baseline of environmental conditions at the Site and immediate surrounding receiving environments. It is noted that groundwater impacts identified independently of this assessment and the current site operator (EnergyAustralia) has been developing appropriate management approaches alongside independent consultants and regulators. On the basis of the outcomes of this Phase 2 ESA, it is considered that further monitoring may be required in these areas as follows:
  - Groundwater – It is recommended that the integrity of the UST and lines in the vicinity of MJ\_X\_MWMP1 be tested to confirm the absence of sub-surface leaks. Additional confirmatory groundwater sampling is also recommended at this location to confirm the measured concentrations of benzene with specific reference to clarification of the duty to report contamination under *Section 60 of the CLM Act (1997)*.
  - Groundwater – Additional groundwater monitoring and gauging in AEC ME is recommended at the cross-gradient locations near ME\_X\_MWMP8, to confirm the delineation of LNAPL prior to reporting to NSW EPA. This may already be scheduled as part of the existing scheduled UPSS monitoring program and/or separate investigations initiated by Energy Australia with SMEC. It is recommended that the integrity of the oil pit and the adjacent oil-water interceptor in AEC ME is tested to investigate the potential source of LNAPL contamination in this area. It is further recommended that the sewer main and the drainage pipe from the oil-water interceptor be investigated to determine the potential for preferential migration pathways of LNAPL in this area.

Stage	Area	Sampling Element	SB	MW	SS	SW	Total Locations	Existing MWs	SBs from other AECs	Wells From Adjacent AECs	Total GW Locations (Existing + New)	Total Soil Locations (SB + MW)	Total Water Locations (Existing MW + MW + SW)	Total Soil/Sed Locations (SB + MW + SS)	Operational Constraints
Proposed	MA	Former Landfills	0	12	0	0	12	0	-	--	12	12	12		The landfills are located in non-operational areas with access limited to tracks and roadways due to dense bush and scrub surrounding the locations. Overhead high voltage electricity cables also pose a high risk and locations may be moved and/or abandoned if sufficient clearance from the overhead cables cannot be achieved.
Actual	MA	Former Landfills	3	3	0	0	9	3	3	3	9	9	9		Change in CSM (see discussion in text). Above operational constraints also reduced suitable drilling locations. Additional soil and groundwater data incorporated from existing monitoring wells and from adjacent AECs.
Proposed	MB	Coal Storage Area	0	5	0	0	5	0	-	--	5	5	5		The coal storage area is an active operational area with multiple hazards. Therefore boreholes are proposed around the perimeter of the area with the locations dependent on infrastructure and access for vehicles.
Actual	MB	Coal Storage Area	1	4	0	0	5	1	6	1	7	11	7		A monitoring well could not be installed at MB_MW01 due to refusal at shallow depth, and this location was a soil bore only. Additional monitoring wells from adjacent AECs provide additional lines of evidence to assess AEC MB.
Proposed	MC	Electrical Transformers	0	4	0	0	4	0	-	--	4	4	4		Sampling locations in this area are restricted to the perimeter of the designated excluded area as well as being outside of the buffer for the high voltage overhead cables.
Actual	MC	Electrical Transformers	0	4	0	0	4	0	-	2	6	4	6		All locations proposed were completed.
Proposed	MD	Workshops	0	5	0	0	5	0	-	--	5	5	5		Sampling locations are proposed outside of workshop buildings and on unpaved areas where feasible.
Actual	MD	Workshops	6	3	0	0	4		2	2	5	8	5		Monitoring wells could not be installed at 2 locations due to proximity to underground utilities. Additional monitoring wells from adjacent AECs provide additional lines of evidence.
Proposed	ME	Mobile Plant Refuelling Area	0	4	0	0	4	0	-	--	4	4	4		Sampling locations are proposed adjacent to the concreted area and shed in the mobile plant refuelling area.
Actual	ME	Mobile Plant Refuelling Area	4	1	0	0	4	7	-	--	8	4	8		Monitoring wells were not completed at three locations due to concurrent investigation by others in this area at the time of drilling. Soil bores were completed at these three locations. Groundwater samples were collected from monitoring wells installed by others in this area, and from adjacent AECs.
Proposed	MF	Operational ASTs	0	5	0	0	5	0	-	--	5	5	5		Sampling locations are proposed outside of the bunded area and on unpaved areas where feasible.
Actual	MF	Operational ASTs	0	5	0	0	5	0	-	--	5	5	5		All locations proposed were completed.
Proposed	MG	Current Ash Repository	3	0	0	0	3	8	-	--	8	3	8		Soil sampling locations are proposed around the perimeter of the ash repository near the location of existing wells. The feasibility of access to these areas may limit the number and location of soil bores.
Actual	MG	Current Ash Repository	2	0	0	0	2	8	-	--	8	2	8		One soil bore was located outside the Site boundary and a suitable location within the Site could not be located.
Proposed	MH	Lamberts North Ash Repository	6	1	3	3	10	8	-	--	9	7	9		Soil sampling locations are proposed around the perimeter of the ash repository near the location of existing wells. The feasibility of access to these areas may limit the number and location of soil bores.
Actual	MH	Lamberts North Ash Repository	5	3	2	2	6	5	1	3	11	6	12		Change in CSM (see discussion in text). Operational constraints also reduced suitable drilling locations, and not all of the existing monitoring wells could be located. Two additional monitoring wells were installed in the former mine area.
Proposed	MI	Water Holding Ponds	8	0	0	0	8	6	-	--	6	8	6		Soil sampling locations are proposed around the water holding ponds near the location of existing wells.
Actual	MI	Water Holding Ponds	7	0	0	0	6	6	-	--	6	6	6		Hand clearance at one location was terminated at a shallow depth due to presence of coarse fill material and rubble, and insufficient fines were available for sampling.
Proposed	MJ	Operational USTs	0	0	0	0	0	6	-	--	6	0	6		Soil conditions will be assessed utilising grid base sampling locations in accessible operational areas.
Actual	MJ	Operational USTs	0	0	0	0	0	6	2	2	8	2	8		All locations proposed were completed.
Proposed	MK	Accessible Operational Areas	81	9	0	0	90	0	-	--	9	81	9		A 50 x 50 m grid will be established, with bores eliminated in areas where underground or overhead utilities are present and in hazardous areas. Defined exclusion areas will include the main operations buildings, the transformer yard and areas beneath high voltage overhead cables. Where possible bores will be located on bare ground, although some bores may be required on hardstanding.
Actual	MK	Accessible Operational Areas	73	11	0	0	84	6	10	7	24	83	24		6 soil bore locations were abandoned due to the presence of underground utilities and other operational hazards including traffic. An additional 2 monitoring wells were installed around the perimeter of the operational area. It is considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment.
Proposed	ML	Non Operational Areas	16	24	0	0	40	0	-	--	24	40	24		Locations will be targeted to accessible areas along existing tracks and roads in densely vegetated areas and will consider the location of high voltage overhead cables.
Actual	ML	Non Operational Areas	24	8	0	0	32	-	-	8	16	32	16		Change in CSM (see discussion in text). It is considered that the number and distribution of completed boreholes and monitoring wells is sufficient for characterising soil and groundwater conditions for the purpose of this baseline assessment.
Proposed	MM	Water Assets	0	0	12	12	12	0	-	--	0	0	12		It is noted that access will need to be established to the lakes and sampling will be undertaken by boat.
Actual	MM	Water Assets	0	0	14	14	14	0	-	--	0	0	14		All locations proposed were completed.
Proposed	Proposed Total		114	69	15	15	198	28			97	183	112	198	
Actual	Actual Total		145	42	16	16	203	35			77	187	93	203	
	Difference		31	-27	1	1	5	7			-20	4	-19	5	

**Notes:**  
 SB = Soil Bore (not including bores converted to MW)  
 MW = Soil Bore converted to Groundwater Monitoring Well  
 SS = Sediment Sample  
 Total Locations = SB + MW (or SS)  
 Existing MWs = based on available reports and assumes wells are operational for sampling.  
 Total MWs = proposed wells + existing wells

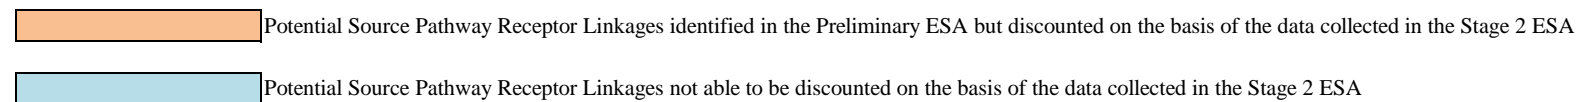

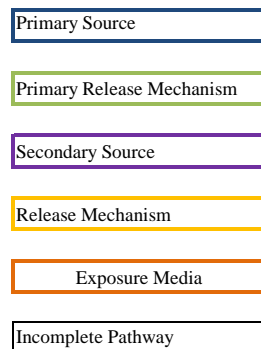

Annex C

Refined CSM

**LEGEND**

Notes:

(\*) Exposure limited to volatile compounds as defined in the text; residential and worker receptors include both indoor and outdoor air exposure to volatiles; nonresidential and nonworker receptors include only outdoor air exposure. For residents, inhalation of volatiles from shallow groundwater includes pathways associated with both domestic use and migration to indoor air, whereas, nonresidential exposure includes only migration to indoor and outdoor air for workers and only outdoor air for recreators. Exposure to fugitive dust is limited to non-volatile organic compounds.

(^\*) Exposure pathway incomplete where hardstanding is present in operational areas and roadways. It is also noted that vegetation in operational areas is typically limited to grasses with shallow root zones.

Annex F

Quality Assurance Quality  
Control

COMMERCIAL IN CONFIDENCE

The objective of this data assessment is to evaluate the quality of data gathered during the project. This process has been undertaken to assess whether the sample data is of a suitable standard to be utilised in this report. The data assessment consists of comparing field and laboratory QA/QC results to documented NEPM, ANZECC, USEPA SW-846 guidelines, USEPA CLP National Functional Guidelines for Inorganic and Organic Data Review, and other internationally recognised publications. The data assessment has been prepared in accordance with the NEPC (2013) *National Environmental Protection (Assessment of Site Contamination) Measure 1999* and NSW EPA (1997) *Guidelines for Consultants Reporting on Contaminated Sites* and NSW DEC (2006) *Guidelines for the NSW Site Auditor Scheme (2<sup>nd</sup> Edition)*. Particular reference is made to the PARCC parameters (precision, accuracy, representativeness, completeness and comparability) in evaluating the data quality.

Table F1 presents the degree of QA/QC pertinent to the field investigations.

Table F2 presents the degree of QA/QC pertinent to the laboratory program.

The data quality indicators of precision, accuracy, representativeness, comparability and completeness have been assessed as shown in Table F3.

Table F1 Field QA/QC Assessment

QA/QC Criterion	Comments
QA/QC program includes replicate samples	Field quality control samples including 25 intra-laboratory duplicates (15 soil, 8 groundwater, 1 surface water and 1 sediment) were analysed to demonstrate the suitability of the validation program. 12 inter-laboratory duplicate samples (7 soil and 5 groundwater) were sent to a secondary laboratory.  The number of samples analysed, including QA/QC replicates, is presented in Table F.4.  Duplicate samples were collected following ERM standard operating procedures, at a ratio slightly below the required ratio of one duplicate for 10 primary samples (1:10); however this is not considered to have material impacts on the investigation.
All relevant media assessed	Soil and groundwater samples were collected from all identified Areas of Environmental Concern (AECs) as part of the characterisation program.
Appropriateness of sampling strategy	Based on the results of the Preliminary ESA and consideration of the intended approach to establishing a baseline of soil and groundwater contamination, the most appropriate sampling design was considered to be a judgemental (targeted) sampling of soil, groundwater, surface water and sediments at the established AECs for the Site. The spatial coverage achieved was considered to be suitable in achieving the project objectives within the constraints of safe and reasonable access. Where investigation locations were not able to be completed due to logistical issues, these were discussed in the report.

COMMERCIAL IN CONFIDENCE

QA/QC Criterion	Comments
Sample collection, handling and transportation procedures.	<p>Samples were collected, handled and transported following ERM standard operating procedures as described in the <i>Project Symphony Sampling and Analysis Quality Plan [Reference 0207423RP01SAQP_DRAFT]</i> (ERM, 2013a).</p>
Sampling is representative of site conditions	<p>Representative samples were collected from all identified AECs including soil, groundwater, surface water and sediment.</p> <ul style="list-style-type: none"> <li>• Field screening - including PID measurements and visual/olfactory observations were noted throughout the drilled profile.</li> <li>• Sample Collection - samples were generally collected at the surface and 0.5 m intervals for the first 2 m and every 1 m thereafter, or where changes in lithological units or significant contamination were noted.</li> <li>• Sample Analysis - generally one shallow sample targeting fill and the zone of surface impacts (0-1.5 m bgl) and one deeper sample targeting natural soil/geology between vadose zone and water bearing unit. Shallow bedrock and refusal on rubble restricted collecting a second sample from the deeper soil profile.</li> <li>• Groundwater - selected soil bores were converted to monitoring wells and groundwater samples were collected. Groundwater monitoring wells were selected to target areas with potential impact or boundary/background areas and to aid in the assessment of groundwater flow directions.</li> </ul>
Field QA/QC plan	<p>The sampling team comprised suitably qualified and experienced ERM environmental scientists.</p> <p>Borehole logs and/or other sampling records were completed, describing the media sampled, the duplicate types and sampling locations.</p> <p>Samples were collected using a combination of hand auger (during NDD), push tube, and where geology necessitated - solid flight auger drilling techniques. Soil samples were placed in laboratory supplied sample jars, stored in an insulated cooler, and forwarded to the NATA accredited laboratory under COC conditions. The methods used to collect the samples, the types of sample containers, preservation techniques and custody protocols were documented appropriately.</p> <p>Inter-laboratory and intra-laboratory analytical results and their relative percentage differences (RPDs) are presented in <i>Table F5 Series</i>. Where samples were collected from push tube cores, samples were not homogenised prior to splitting to minimise loss of volatile analytes. Volatile analytes may have been lost where samples were collected from hand augers and solid flight augers. The RPDs of the duplicate sample pairs were generally below the acceptance limits (30% RPD where one or both values were greater than 10 x LOR or 50% RPD where both values less than 10 x LOR). An evaluation of the analytical data indicated that the data was generally of acceptable precision and accuracy. Minor exceedences of RPD acceptable limits were noted for some primary and duplicate sample pairs, as presented in <i>Table F5 Series</i> and summarised below.</p> <p>Decontamination procedures were implemented between the collection of different groundwater samples. Cross contamination was not considered likely during soil sampling from disposable push tube liners, and decontamination was not undertaken. The processes followed were considered suitable for minimising cross-contamination during sampling. Rinsate blanks were collected to demonstrate the efficacy of the decontamination procedures during groundwater sampling (refer to <i>Table F6</i>).</p>

## COMMERCIAL IN CONFIDENCE

QA/QC Criterion	Comments
	<p>Contaminants of concern were below the laboratory limit of reporting in the rinsate samples with the minor exceptions presented in <i>Table F6</i> and summarised below.</p> <p>Trip blank samples were collected as part of this investigation. All COPCs were reported below the laboratory LOR (refer to <i>Table F7 Series</i>).</p> <p>Trip spikes were collected as part of this investigation. Comparison with a trip spike control sample retained by the laboratory did not indicate unacceptable loss of volatile analytes during sample transport with the exception of one batch of soil samples (refer to <i>Table F8 Series</i>). Further discussion on trip spike non-conformances for soil and sediment samples are provided below.</p> <p>Field instruments used as part of this investigation were appropriately calibrated and used according to the manufacturers' instructions. Calibration certificates are provided in <i>Annex E</i>.</p>

### *Field QA/QC Exceedences*

Minor exceedences of field duplicate RPD acceptable limits were noted for primary and duplicate samples, as presented in *Table F5 Series*. Elevated relative percentage differences (RPDs) between soil/sediment duplicate samples were generally attributed to the heterogeneity of the soil matrix. The analytes were well below the adopted guideline value (where available) and therefore these non-conformances were not expected to materially affect the outcomes of this investigation. Elevated RPDs between some groundwater/surface water duplicate sample pairs were generally associated with heavy metals. The range in metal concentrations are considered representative of background levels. These non-conformances were not expected to materially affect the outcomes of this investigation.

Rinsate samples collected during groundwater sampling were taken following decontamination of the interface probe, or from the micropurge pump (when used). Of the 14 rinsate samples collected during the groundwater and surface water sampling program, two rinsate samples were reported to contain minor concentrations of iron, copper and manganese. It is noted that the concentrations of heavy metals detected in the rinsate samples were close to the LOR and did not exceed concentrations measured in groundwater collected from areas considered to represent background concentrations on-site. While the rinsate samples suggest there may have been some minor cross-contamination of low-level heavy metals, this is unlikely to materially affect the outcomes of the investigation.

Eight out of Twelve trip spikes analysed as part of the drilling/soil and sediment sampling program were not within the acceptable recovery limits of 70% to 130% compared to the corresponding trip spike control samples held by the laboratory. One trip spike sample reported ethylbenzene and xylene recoveries exceeding 130%. Soil samples MK\_SB43\_0.2, MK\_SB44\_0.2, MK\_SB62\_0.2, MK\_SB84\_0.2, D01\_061113\_TS and T01\_061113\_TS were transported with this trip spike. Ethylbenzene and xylene concentrations were reported in field samples below the LOR and indicate trip spike results have not affected primary results.

COMMERCIAL IN CONFIDENCE

Seven trip spike samples reported recoveries below 70% compared to the trip spike control samples, suggesting that there was a loss of volatiles during handling and transport. Laboratory supplied trip spikes were typically obtained and held by ERM up to a week prior to use with samples. It is also possible that loss of volatiles occurred during this period and prior to sampling and dispatch to the laboratory.

A review of the borelogs from samples analysed in laboratory batches reporting trip spike recoveries less than acceptable limits typically indicated that PID field screening results were less than 5 ppm v, suggesting that VOCs were not a significant contaminant in these samples. Over the period of investigation, PID screening results exceeded 5ppm at two locations across the site - MD\_MW04 and MK\_SB87. Soils sampled from both locations were submitted with batch ES1323862 (benzene trip spike recovery of 67%). TRH C<sub>6</sub>-C<sub>9</sub> and TRH C<sub>6</sub>-C<sub>10</sub> was detected at both locations and generally correlates with PID results, the concentration of benzene was reported below laboratory LOR. These results should be assessed with consideration for this non-conformance.

Trip spike and trip blank samples were utilised in the majority of batches submitted to the laboratory. Where trip spike and trip blank samples did not accompany samples, the primary samples for analysis of VOCs were generally received in good condition under chain of custody conditions and analysed within the recommended holding times. The temperature of samples on receipt at the laboratory however ranged from 2.5 - 16.8 °C (although it is noted all samples were packed with ice in insulated coolers prior to dispatch via courier from the Site. As noted above, field observations and PID screening results correlate with laboratory results and thus the instances of elevated sample temperatures are considered unlikely to have materially affected results or the interpretation of the dataset.

Table F2 Laboratory QA/QC Assessment

QA/QC Criterion	Comments
Appropriate methodologies used for sample analyses	The primary laboratory used for the investigation was NATA accredited ALS, NATA Registration No. 825. The secondary laboratory used for the investigation was NATA accredited Envirolab, NATA Registration No 2901. All laboratory reports were NATA stamped and signed by a NATA signatory. All analytical methodologies were considered appropriate for the identified contaminants of potential concern in the matrix.
	Statistical data presented in the laboratory QA/QC report was considered adequate in demonstrating the precision and accuracy of the methods used to analyse field samples.
Appropriate practical quantitation limits (LORs)	LORs for each analyte are presented in the laboratory reports. All sample results were reported with LORs below the site assessment criteria with the exception of a small number of volatile organic compounds in groundwater (vinyl chloride, chloromethane, bromomethane, 1,2-Dichloroethane, hexachlorobutadiene, 1,2,3-trichlorobenzene and 1,2-dibromomethane), PAH compounds (Benzo(a) pyrene and Carcinogenic PAHs (as BaP TEQ), mercury and selenium, and PAHs in sediments (Acenaphthene, Acenaphthylene Anthracene, Anthracene, Benzo(a) pyrene, Naphthalene, Chrysene, Dibenz(a,h)anthracene, Fluoranthene, Fluorene, Pyrene, Phenanthrene).

COMMERCIAL IN CONFIDENCE

QA/QC Criterion	Comments
Laboratory QA/QC plan	<p data-bbox="488 230 1356 264">Copies of signed chain of custody forms were returned by the laboratory.</p> <p data-bbox="488 282 1356 667">Samples were received and analysed within specified laboratory holding times with the exception of those soil samples listed in <i>Table F9</i>. This information was documented on the laboratory reports. In most cases the sample was only marginally analysed outside of the recommended laboratory holding time, which is not considered to have material effects on the investigation. Due to a scheduling error, mercury in shallow soils sampled from area MG were extracted 55 days outside of appropriate holding times (28 days). Mercury was detected in only five soil samples collected across the site where concentrations were reported between 0.1-0.2 mg/kg and marginally above the LOR (0.1mg/kg). These results are well below the adopted criteria of 730 mg/kg the noted holding time exceedences are not therefore considered to significantly impact upon the outcome of results.</p> <p data-bbox="488 685 1356 748">The analytical methods used were NATA approved as documented on the laboratory reports.</p> <p data-bbox="488 766 1356 898">Laboratory quality control samples included laboratory control samples, internal duplicates, matrix spikes and method blanks. The types of QA/QC samples analysed by the laboratory for the documented samples were considered sufficient to assess the precision and accuracy of the laboratory methods used.</p> <p data-bbox="488 916 1356 1043">The statistical data presented in the laboratory QA/QC report was considered adequate in demonstrating the precision and accuracy of the methods used to analyse field samples. Minor exceedences of the acceptance criteria were noted, as presented in <i>Table F10 Series</i> to <i>Table F12 Series</i> and <i>Table F13</i>.</p>

*Table F3 Overall Sampling and Analysis Methodology Assessment*

Field Considerations	Laboratory Considerations
<b>Precision Requirements</b>	
The investigation was conducted following ERM SOPs and any variations from these procedures were documented.	<p data-bbox="767 1238 1241 1267">Analysis of the following were reported:</p> <ul data-bbox="767 1272 1241 1402" style="list-style-type: none"> <li data-bbox="767 1272 1241 1335">• laboratory and inter-laboratory duplicates;</li> <li data-bbox="767 1339 1241 1368">• field duplicates; and</li> <li data-bbox="767 1373 1241 1402">• laboratory prepared volatile trip spikes.</li> </ul>

## COMMERCIAL IN CONFIDENCE

Field Considerations	Laboratory Considerations
<b>Precision Comments</b>	
<p>No significant variations from ERM SOPs were noted. Due to the nature of typically gravel and cobble fill overlying bedrock across the site, subsequent drilling techniques (non-destructive drilling, solid flight auger and air hammer) did not allow for soil to be sampled and / or screened with a PID in accordance with ERM's SOP. Elevated PID readings correlate well with analytical results and a lack of field screening using PID is therefore not considered to affect the dataset or sampling program. Field split duplicates were generally reported within the acceptance limits of 30% RPD where one or both values were greater than 10 x LOR or 50% RPD where both values less than 10 x LOR. Minor exceedences were noted, as presented in <i>Table F5 Series</i>. Trip spike recoveries were within the acceptance limits of 70% to 130% RPD. Exceedences were noted, as presented in <i>Table F8 Series</i>. Trip spike recoveries from seven trip spikes were not within acceptable ranges. As discussed previously, these results are generally not considered to affect analytical results. However analytical data for volatile contaminants from laboratory reports ES1323862 must be considered as estimate only. It is noted that PID field screening results from samples collected as part of these laboratory batches, where available, correlated with results of analysis or otherwise suggested that volatiles were not likely to be present. The site activities in the AECs where these samples were collected were considered unlikely to lead to impact from VOCs, with the exception of Workshops (AEC MD), where washing solvents may contribute to VOCs in soil.</p>	
<b>Accuracy Requirements</b>	
<p>The investigation was conducted following ERM SOPs and any variations from these procedures were documented.</p>	<p>Analysis of the following were reported:</p> <ul style="list-style-type: none"><li>• field blanks;</li><li>• rinsate blanks;</li><li>• reagent blanks;</li><li>• method blanks;</li><li>• matrix spikes;</li><li>• surrogate spikes;</li><li>• laboratory control samples; and</li><li>• laboratory prepared spikes.</li></ul>
<b>Accuracy Comments</b>	
<p>No significant variations from ERM SOPs were noted. Laboratory QA/QC samples were reported within the acceptance limits specified in the laboratory reports. Exceptions are presented in <i>Table F10 Series</i> to <i>Table F12 Series</i> and <i>Table F13</i> and the laboratory reports.</p>	
<b>Representativeness Requirements</b>	
<p>Appropriate media were identified and sampled according to the SAQP.</p>	<p>All samples were analysed in general accordance with the SAQP.</p>
<b>Representativeness Comments</b>	

## COMMERCIAL IN CONFIDENCE

---

Field Considerations	Laboratory Considerations
----------------------	---------------------------

---

No exceedences of the requirements were noted.

### Comparability Requirements

The same SOPs were used during each sampling event.

Analytical methods suitable for the target media were used.

All sampling was conducted by an appropriately qualified and experienced sampler.

The LORs used to report analyte concentrations were less than the adopted investigation levels.

The types of samples collected were consistent.

The same laboratories were used to analyse all sample.

Results of Field Screening comparable with Lab analysis.

The same units were used to report analyte concentrations.

Results of Lab analysis comparable with field screening results.

Results of TPH C6-C9 comparable to BTEX etc.

### Comparability Comments

All sample results were reported with LORs below the site assessment criteria with the exception of a small number of VOCs, PAH compounds, mercury and selenium.

### Completeness Requirements

All critical locations were sampled (from grid and at depth).

All critical samples were analysed according to SAQP.

The investigation was conducted following ERM SOPs and variations from these procedures were documented.

All analytes were analysed according to the SAQP.

All sampling was conducted by an appropriately qualified and experienced sampler.

Appropriate analysis methods and LORs were used.

Sample documentation was provided.

Documentation of field works was provided.

Sample holding times were complied with.

### Completeness Comments

Holding time exceptions are presented in *Table F9 Series* and the laboratory reports. Where investigation locations were not able to be completed due to logistical issues, these were discussed in *Table 3.1* in the report. A number of LORs for VOCs in groundwater and PAHs in sediment were below adopted assessment criteria and were discussed in Section 3.5.3 of the report. Given the extent of investigation successfully completed across the site, including targeting of potential sources within AECs, the variations from the SAQP were minor and are generally not considered to affect the outcomes of the investigation.

\*RPDs have only been considered where a concentration is greater than 1 times the detection limit.  
 \*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are:  
 \*\*\*Interlab Duplicates are matched on a per compound basis as methods vary

1. Soil and sediment samples were not homogenised prior to sampling to minimise the risk of cross-contamination. The elevated RPD is likely a result of the heterogeneity of the samples. The concentration is well below the adopted guidelines value (where available) and therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.

2. Soil and sediment samples were not homogenised prior to sampling to minimise the risk of cross-contamination. The elevated RPD is likely a result of the heterogeneity of the samples. The concentration exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.

3. The concentration is close to the laboratory detection limit and the elevated RPD is likely a result of the heterogeneity of the samples. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x EQL); 30 (> 20 x EQL) )

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

1. Soil and sediment samples were not homogenised prior to sampling to minimise volatilisation of volatile contaminants. The elevated RPD is likely a result of the heterogeneity of the soil matrix. The concentration is well below the adopted guidelines value (where available) and therefore this RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
2. Soil and sediment samples were not homogenised prior to sampling to minimise volatilisation of volatile contaminants. The elevated RPD is likely a result of the heterogeneity of the soil matrix. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small difference between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x EQL); 30 (> 20 x EQL) )

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

1. RPD exceeds the acceptable limit however concentration is well below the adopted guideline value therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.
2. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small different between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
4. The RPD exceeds the acceptable limits. The higher value was reported for conservatism.
5. The RPD exceeds the acceptable criteria. Metal concentrations are considered within the range of background concentrations and this non-conformance is unlikely to materially effect the outcomes of this investigation.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x EQL); 30 (> 20 x EQL) )

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

1. RPD exceeds the acceptable limit however concentration is well below the adopted guideline value therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.
2. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small different between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
4. The RPD exceeds the acceptable criteria. Metal concentrations are considered within the range of background concentrations and this non-conformance is unlikely to materially effect the outcomes of this investigation.
5. The RPD exceeds the acceptable limits. The higher value was reported for conservatism.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any m

1. RPD exceeds the acceptable limit however concentration is well below the adopted guideline value therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.
2. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small different between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
4. The RPD exceeds the acceptable criteria. Metal concentrations are considered within the range of background concentrations and this non-confirmation is unlikely to materially effect the outcomes of this investigation.
5. The RPD exceeds the acceptable limits. The higher value was reported for conservatism.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x EQL); 30 (> 20 x EQL) )

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

1. RPD exceeds the acceptable limit however concentration is well below the adopted guideline value therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.
2. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small different between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
4. The RPD exceeds the acceptable limits. The higher value was reported for conservatism.
5. The RPD exceeds the acceptable criteria. Metal concentrations are considered within the range of background concentrations and this non-conformance is unlikely to materially effect the outcomes of this investigation.

1. Soil and sediment samples were not homogenised prior to sampling to minimise volatilisation of volatile contaminants. The elevated RPD is likely a result of the heterogeneity of the soil matrix. The concentration is well below the adopted guidelines value (where available) and therefore this RPD non-conformance is unlikely to materially effect the outcomes of this investigation.

2. Soil and sediment samples were not homogenised prior to sampling to minimise volatilisation of volatile contaminants. The elevated RPD is likely a result of the heterogeneity of the soil matrix. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.

3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small difference between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-20 x EQL); 30 (> 20 x EQL) )

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

1. RPD exceeds the acceptable limit however concentration is well below the adopted guideline value therefore this non-conformance is unlikely to materially effect the outcomes of this investigation.
2. The RPD marginally exceeds the acceptable criteria and this non-conformance is unlikely to materially effect the outcomes of this investigation.
3. The concentration is close to the laboratory detection limit and the elevated RPD is a result of the small difference between the low concentrations. This RPD non-conformance is unlikely to materially effect the outcomes of this investigation.
4. The RPD exceeds the acceptable limits. The higher value was reported for conservatism.
5. The RPD exceeds the acceptable criteria. Metal concentrations are considered within the range of background concentrations and this non-conformance is unlikely to materially effect the outcomes of this investigation.

Annex G

Photolog

### Photograph 1

Numac conducting non-destructive digging works at MK\_SB09, view east. An open drainage channel can be seen in the foreground and general power station infrastructure in the background.

### Photograph 2

Numac concrete coring at MC\_MW03, view west. Active and disused transformers can be seen along the right of frame.

### Photograph 3

Drainage channel and exposed bedrock between MK\_SB18 and MK\_SB19, view north. Part of the coal conveyor can be seen in the right of frame.

**Photograph 4**

Location of MD\_MW02 (near) and MD\_MW03 (far), view east. The workshop and equipment store is in the right of frame. Hunter-Smith are conducting Ground Penetrating Radar scans in the background.

**Photograph 5**

Location of MH\_MW03, view south. Lamberts North Ash Repository is in the right of frame.

**Photograph 6**

Abandoned septic tank and barricading within the former contractors yard (AEC – ML).

**Photograph 7**

Rock outcropping, red sand and storage shed located within former contractors' yard, view north (AEC – ML).

**Photograph 8**

Abandoned drums located within the former contractors yard, view southeast (AEC – ML).

**Photograph 9**

Abandoned electronic equipment within the former contractors yard, view northwest (AEC – ML).

**Photograph 10**

Abandoned drum in drainage channel within former contractor yard, view east (AEC – ML).

**Photograph 11**

Bulk oil storage in the vicinity of MK\_SB78 and MK\_SB79, view north.

**Photograph 12**

MB\_MW04 location, view northeast. A portion of the coal stockpile and dry storage shed are visible

**Photograph 13**

Water holding ponds and some pumping infrastructure, view northwest (AEC – MI).

**Photograph 14**

Pale grey and orange siltstone outcrop at the Former Contractors Yard (AEC – ML) is typical of site geology.

**Photograph 15**

Coal outcropping at the surface of the Former Contractors Yard (AEC – ML).

**Photograph 16**

Oil interceptor pit located alongside the mobile plant refuelling area and workshop, view east (AEC – ME).

**Photograph 17**

Confirmed LNAPL within bailer sampled from ME\_X\_MWMP7, within the vicinity of the mobile plant refuelling area and workshop.

**Photograph 18**

Confirmed LNAPL within bailer sampled from ME\_X\_MWMP8, within the vicinity of the mobile plant refuelling area and workshop.

**Photograph 19**

Diesel bowsers and location of diesel UST at the mobile plant refuelling area and workshop, view northeast (AEC – ME).

**Photograph 20**

Typical fill material encountered during non-destructive digging works across the investigation area.

**Photograph 21**

Coal washery rejects ponds in the vicinity of MH\_MW01 and MH\_MW02, view northwest.

**Photograph 22**

Dam wall between freshwater dam and the coal washery rejects ponds, view west (AEC – MH).

**Photograph 23**

Fuel bowsers adjacent to workshop, view southeast (AEC – MJ).

**Photograph 24**

Fenced compound around the former general waste landfill, view northeast from access road (AEC – MA).

**Photograph 25**

Thompsons Creek Reservoir, view west from spillway.

**Photograph 26**

Thompsons Creek Reservoir compressor building.

**Photograph 27**

Lake Lyell, view east from public camping area on western shore.

**Photograph 28**

Lake Lyell spillway, view east from pump house.

## Laboratory Certificates

**CERTIFICATE OF ANALYSIS**

**100833**

**Client:**

**Environmental Resources Management Australia**

Locked Bag 24

Broadway

NSW 2007

**Attention:** Jonathan Lekawksi

**Sample log in details:**

Your Reference:

**Wallerawang/ Mt Piper GW**

No. of samples:

1 water

Date samples received / completed instructions received

14/11/13

/ 14/11/13

**Analysis Details:**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

***Please refer to the last page of this report for any comments relating to the results.***

**Report Details:**

Date results requested by: / Issue Date:

21/11/13

/

21/11/13

Date of Preliminary Report:

Not issued

NATA accreditation number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025.

**Tests not covered by NATA are denoted with \*.**

**Results Approved By:**

Jacinta Hurst

Fluoride, F	mg/L	0.41

MethodID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Inorg-030	Total Phenolics - determined colorimetrically following disitillation, based upon APHA 22nd ED 5530 D.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA 22nd ED, 2320-B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA 22nd ED, 4110-B.
Inorg-041	Gravimetric determination of the total solids content of water using APHA 22nd ED 2540B.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-026	Fluoride determined by ion selective electrode (ISE) in accordance with APHA 22nd ED, 4500-F-C.

**Report Comments:**

ION\_BALANCE: # Percent recovery is not possible to report due to the high concentration of the element/s in the sample/s. However an acceptable recovery was obtained for the LCS.

Asbestos ID was analysed by Approved Identifier: Not applicable for this job  
Asbestos ID was authorised by Approved Signatory: Not applicable for this job

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

**Quality Control Definitions**

**Blank:** This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

**Duplicate:** This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

**Matrix Spike:** A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

**LCS (Laboratory Control Sample):** This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

**Surrogate Spike:** Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

**Laboratory Acceptance Criteria**

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

No. of samples:

1 water

Date samples received / completed instructions received

19/12/2013 / 19/12/2013

**Analysis Details:**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

***Please refer to the last page of this report for any comments relating to the results.***

**Report Details:**

Date results requested by: / Issue Date:

8/01/14 / 6/01/14

Date of Preliminary Report:

Not issued

NATA accreditation number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025.

**Tests not covered by NATA are denoted with \*.**

**Results Approved By:**

Ferrous Iron	mg/L	2.0

MethodID	Methodology Summary
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Inorg-030	Total Phenolics - determined colorimetrically following disitillation, based upon APHA 22nd ED 5530 D.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA 22nd ED, 2320-B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA 22nd ED, 4110 -B.
Inorg-041	Gravimetric determination of the total solids content of water using APHA 22nd ED 2540B.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-026	Fluoride determined by ion selective electrode (ISE) in accordance with APHA 22nd ED, 4500-F-C.
Inorg-076	A sample is determined colourimetrically by discrete analyser based on APHA 22nd ED 3500-Fe B.

**Report Comments:**

Asbestos ID was analysed by Approved Identifier: Not applicable for this job  
 Asbestos ID was authorised by Approved Signatory: Not applicable for this job

INS: Insufficient sample for this test      PQL: Practical Quantitation Limit      NT: Not tested  
 NA: Test not required                      RPD: Relative Percent Difference      NA: Test not required  
 <: Less than                                  >: Greater than                              LCS: Laboratory Control Sample

**Quality Control Definitions**

**Blank:** This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

**Duplicate:** This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

**Matrix Spike :** A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

**LCS (Laboratory Control Sample) :** This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

**Surrogate Spike:** Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

**Laboratory Acceptance Criteria**

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

**Sample log in details:**

Your Reference:	<b>0207420, Symphony Delta West</b>
No. of samples:	1 water
Date samples received / completed instructions received	19/12/2013 / 19/12/2013

**Analysis Details:**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

***Please refer to the last page of this report for any comments relating to the results.***

**Report Details:**

Date results requested by: / Issue Date: 8/01/14 / 6/01/14

Date of Preliminary Report: Not issued

NATA accreditation number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with \*.**

**Results Approved By:**

MethodID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Inorg-030	Total Phenolics - determined colorimetrically following disitillation, based upon APHA 22nd ED 5530 D.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA 22nd ED, 2320-B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA 22nd ED, 4110 -B.
Inorg-041	Gravimetric determination of the total solids content of water using APHA 22nd ED 2540B.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-076	A sample is determined colourimetrically by discrete analyser based on APHA 22nd ED 3500-Fe B.
Inorg-026	Fluoride determined by ion selective electrode (ISE) in accordance with APHA 22nd ED, 4500-F-C.

Asbestos ID was analysed by Approved Identifier: Not applicable for this job  
 Asbestos ID was authorised by Approved Signatory: Not applicable for this job

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

**Quality Control Definitions**

**Blank:** This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

**Duplicate:** This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

**Matrix Spike :** A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

**LCS (Laboratory Control Sample) :** This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

**Surrogate Spike:** Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

**Laboratory Acceptance Criteria**

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

**CERTIFICATE OF ANALYSIS**

**103024**

**Client:**

**Environmental Resources Management Australia**

Locked Bag 24

Broadway

NSW 2007

**Attention:** Jonathan Lekawksi

**Sample log in details:**

Your Reference:

**0207423, Symphony Mt Piper**

No. of samples:

2 waters

Date samples received / completed instructions received

23/12/2013 / 23/12/2013

**Analysis Details:**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

***Please refer to the last page of this report for any comments relating to the results.***

**Report Details:**

Date results requested by: / Issue Date:

8/01/14 / 7/01/14

Date of Preliminary Report:

Not issued

NATA accreditation number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025.

**Tests not covered by NATA are denoted with \*.**

**Results Approved By:**

MethodID	Methodology Summary
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Inorg-030	Total Phenolics - determined colorimetrically following disitillation, based upon APHA 22nd ED 5530 D.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA 22nd ED, 2320-B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA 22nd ED, 4110 -B.
Inorg-041	Gravimetric determination of the total solids content of water using APHA 22nd ED 2540B.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.

**Report Comments:**

Asbestos ID was analysed by Approved Identifier: Not applicable for this job  
 Asbestos ID was authorised by Approved Signatory: Not applicable for this job

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

**Quality Control Definitions**

**Blank:** This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

**Duplicate:** This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

**Matrix Spike :** A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

**LCS (Laboratory Control Sample) :** This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

**Surrogate Spike:** Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

**Laboratory Acceptance Criteria**

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

NATA Accredited Laboratory 825

Accredited for compliance with  
ISO/IEC 17025.

### Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics
Phalak Inthaksone	Laboratory Manager - Organics	Sydney Organics

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited  
Laboratory 825

Accredited for  
compliance with  
ISO/IEC 17025.

### Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics
Phalak Inthaksone	Laboratory Manager - Organics	Sydney Organics

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :            Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
                  CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
                  LOR = Limit of reporting  
                  RPD = Relative Percentage Difference  
                  # = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR:- No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:- 0% - 20%.

Sub-Matrix: **WATER**

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: \* = Holding time breach ; ✓ = Within holding time.

Method Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(where) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: \* = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Alkalinity by PC Titrator	ED037-P	2	20	10.0	10.0	✓	NEPM 2013 Schedule B(3) and ALS QCS3 requirement

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	APHA 21st ed., 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Sulfate (Turbidimetric) as SO <sub>4</sub> <sup>2-</sup> by Discrete Analyser	ED041G	WATER	APHA 21st ed., 4500-SO <sub>4</sub> Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO <sub>4</sub> suspension is measured by a photometer and the SO <sub>4</sub> <sup>2-</sup> concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Chloride by Discrete Analyser	ED045G	WATER	APHA 21st ed., 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	Major Cations is determined based on APHA 21st ed., 3120; USEPA SW 846 - 6010 The ICPAES technique ionises the 0.45um filtered sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Hardness parameters are calculated based on APHA 21st ed., 2340 B. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	(APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020): Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Ferrous Iron by Discrete Analyser	EG051G	WATER	APHA 21st ed., 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Fluoride by PC Titrator	EK040P	WATER	APHA 21st ed., 4500 F--C CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Ionic Balance by PCT DA and Turbi SO4 DA	EN055 - PG	WATER	APHA 21st Ed. 1030F. The Ionic Balance is calculated based on the major Anions and Cations. The major anions include Alkalinity, Chloride and Sulfate which determined by PCT and DA. The Cations are determined by Turbi SO4 by DA. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Volatile Organic Compounds	EP074	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2). ALS default excludes sediment which may be resident in the container.

## Summary of Outliers

### Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

#### Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
<b>Laboratory Control Spike (LCS) Recoveries</b>							
EP074E: Halogenated Aliphatic Compounds	3687444-002	----	Trichlorofluoromethane	75-69-4	132 %	65-131%	Recovery greater than upper control limit
EP075(SIM)A: Phenolic Compounds	3685603-013	----	Pentachlorophenol	87-86-5	99.8 %	8.7-95%	Recovery greater than upper control limit
<b>Matrix Spike (MS) Recoveries</b>							
ED045G: Chloride Discrete analyser	ES1321653-004	Anonymous	Chloride	16887-00-6	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.

#### Regular Sample Surrogates

Sub-Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
<b>Samples Submitted</b>							
EP074S: VOC Surrogates	ES1321739-001	MWMP_01	4-Bromofluorobenzene	460-00-4	124 %	80.8-123.7 %	Recovery greater than upper data quality objective

### Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- No Analysis Holding Time Outliers exist.

### Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- No Quality Control Sample Frequency Outliers exist.

## SAMPLE RECEIPT NOTIFICATION (SRN)

#### General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample containers do not comply to pretreatment / preservation standards (AS, APHA, USEPA). Please refer to the Sample Container(s)/Preservation Non-Compliance Log at the end of this report for details.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

## Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
<b>EG051G : Ferrous Iron by Discrete Analyser</b>

## Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

 Project Location: Mt Piper  
 Project Manager: Jonathan Leksanski  
 Sampler: Gavin Powell  
 Laboratory: ALS  
 COC Number: A 13214

General Analysis Requirements

1. Turn Around Time (please tick):  1 Day  2 Days  Normal (TAT)
2. Do you wish any sediment layers in water to be excluded from extractions?
3. Additional QA/QC reported where sample batches are < 10 samples?
4. % of extraneous material removed from samples to be reported as per NERP 5.1.1?

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

NATA Accredited Laboratory 825

Accredited for compliance with  
ISO/IEC 17025.

### *Signatories*

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics
Raymond Commodor	Instrument Chemist	Sydney Inorganics

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

- **EP080: Poor matrix spike recoveries due to matrix effects.confirmed by re-analysis.**
- **EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEX compounds spiked at 20 ug/L.**
- **Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g,h,i)perylene.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited  
Laboratory 825

Accredited for  
compliance with  
ISO/IEC 17025.

### *Signatories*

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics
Raymond Commodor	Instrument Chemist	Sydney Inorganics

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
RPD = Relative Percentage Difference  
# = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR:- No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:- 0% - 20%.

Sub-Matrix: **WATER**

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

## Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: \* = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(where) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: \* = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Reaular	Actual	Expected	Evaluation

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	APHA 21st ed., 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Sulfate (Turbidimetric) as SO <sub>4</sub> <sup>2-</sup> by Discrete Analyser	ED041G	WATER	APHA 21st ed., 4500-SO <sub>4</sub> Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO <sub>4</sub> suspension is measured by a photometer and the SO <sub>4</sub> <sup>2-</sup> concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Chloride by Discrete Analyser	ED045G	WATER	APHA 21st ed., 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	Major Cations is determined based on APHA 21st ed., 3120; USEPA SW 846 - 6010 The ICPAES technique ionises the 0.45um filtered sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Hardness parameters are calculated based on APHA 21st ed., 2340 B. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	(APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020): Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Fluoride by PC Titrator	EK040P	WATER	APHA 21st ed., 4500 F--C CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Ionic Balance by PCT DA and Turbi SO <sub>4</sub> DA	EN055 - PG	WATER	APHA 21st Ed. 1030F. The Ionic Balance is calculated based on the major Anions and Cations. The major anions include Alkalinity, Chloride and Sulfate which determined by PCT and DA. The Cations are determined by Turbi SO <sub>4</sub> by DA. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Analytical Methods	Method	Matrix	Method Descriptions
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Volatile Organic Compounds	EP074	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2). ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

## Summary of Outliers

### Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

#### Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
<b>Matrix Spike (MS) Recoveries</b>							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES1323608-001	TE_MW5	Sulfate as SO4 - Turbidimetric	14808-79-8	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EG020F: Dissolved Metals by ICP-MS	ES1323472-004	Anonymous	Cadmium	7440-43-9	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EG020F: Dissolved Metals by ICP-MS	ES1323472-004	Anonymous	Manganese	7439-96-5	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EG020F: Dissolved Metals by ICP-MS	ES1323472-004	Anonymous	Zinc	7440-66-6	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP080: BTEXN	ES1323549-001	Anonymous	meta- & para-Xylene	108-38-3 106-42-3	45.2 %	70-130%	Recovery less than lower data quality objective
EP080: BTEXN	ES1323549-001	Anonymous	Naphthalene	91-20-3	18.7 %	70-130%	Recovery less than lower data quality objective

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.
- For all matrices, no Laboratory Control outliers occur.

#### Regular Sample Surrogates

- For all regular sample matrices, no surrogate recovery outliers occur.

### Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- No Analysis Holding Time Outliers exist.

### Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- No Quality Control Sample Frequency Outliers exist.

#### General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Samples received in appropriately pretreated and preserved containers.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Due to limited volume , PAH and Phenol analysis will conduct as standard LOR, Please confirm**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

## Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

## Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

NATA Accredited Laboratory 825

Accredited for compliance with  
ISO/IEC 17025.

### Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Hoa Nguyen	Senior Inorganic Chemist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

- **EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEX compounds spiked at 20 ug/L.**
- **Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g,h,i)perylene.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited  
Laboratory 825

Accredited for  
compliance with  
ISO/IEC 17025.

### Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Hoa Nguyen	Senior Inorganic Chemist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
RPD = Relative Percentage Difference  
# = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR:- No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:- 0% - 20%.

Sub-Matrix: **WATER**

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

		No. of samples analysed	: 14

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: \* = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(where) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: \* = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Alkalinity by PC Titrator	ED037-P	2	19	10.5	10.0	✓	NEPM 2013 Schedule B(3) and ALS QCS3 requirement

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	APHA 21st ed., 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Sulfate (Turbidimetric) as SO <sub>4</sub> <sup>2-</sup> by Discrete Analyser	ED041G	WATER	APHA 21st ed., 4500-SO <sub>4</sub> Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO <sub>4</sub> suspension is measured by a photometer and the SO <sub>4</sub> <sup>2-</sup> concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Chloride by Discrete Analyser	ED045G	WATER	APHA 21st ed., 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	Major Cations is determined based on APHA 21st ed., 3120; USEPA SW 846 - 6010 The ICPAES technique ionises the 0.45um filtered sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Hardness parameters are calculated based on APHA 21st ed., 2340 B. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	(APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020): Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Fluoride by PC Titrator	EK040P	WATER	APHA 21st ed., 4500 F--C CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Ionic Balance by PCT DA and Turbi SO <sub>4</sub> DA	EN055 - PG	WATER	APHA 21st Ed. 1030F. The Ionic Balance is calculated based on the major Anions and Cations. The major anions include Alkalinity, Chloride and Sulfate which determined by PCT and DA. The Cations are determined by Turbi SO <sub>4</sub> by DA. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Analytical Methods	Method	Matrix	Method Descriptions
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Volatile Organic Compounds	EP074	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2). ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

## Summary of Outliers

### Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

#### Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
<b>Matrix Spike (MS) Recoveries</b>							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES1323856-008	MG_X_4/D1	Sulfate as SO4 - Turbidimetric	14808-79-8	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES1323856-001	MI_X_5/D2	Sulfate as SO4 - Turbidimetric	14808-79-8	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EG020F: Dissolved Metals by ICP-MS	ES1323856-004	MJ_X_MWMP05	Manganese	7439-96-5	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.
- For all matrices, no Laboratory Control outliers occur.

#### Regular Sample Surrogates

- For all regular sample matrices, no surrogate recovery outliers occur.

### Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- No Analysis Holding Time Outliers exist.

### Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- No Quality Control Sample Frequency Outliers exist.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

NATA Accredited Laboratory 825

Accredited for compliance with  
ISO/IEC 17025.

### *Signatories*

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

- **EG020F: Positive results for sample ES1324232 # 003 have been confirmed by reanalysis.**
- **EN055: Ionic Balance out of acceptable limits for sample ID (TE\_MW16 & D03\_GW\_051113) due to analytes not quantified in this report.**
- **EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEX compounds spiked at 20 ug/L.**
- **Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g,h,i)perylene.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited  
Laboratory 825

Accredited for  
compliance with  
ISO/IEC 17025.

### Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :            Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
                  CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
                  LOR = Limit of reporting  
                  RPD = Relative Percentage Difference  
                  # = Indicates failed QC

### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR:- No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:- 0% - 20%.

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: \* = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(where) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: \* = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
<b>Analytical Methods</b>

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	APHA 21st ed., 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Sulfate (Turbidimetric) as SO <sub>4</sub> <sup>2-</sup> by Discrete Analyser	ED041G	WATER	APHA 21st ed., 4500-SO <sub>4</sub> Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO <sub>4</sub> suspension is measured by a photometer and the SO <sub>4</sub> <sup>2-</sup> concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Chloride by Discrete Analyser	ED045G	WATER	APHA 21st ed., 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	Major Cations is determined based on APHA 21st ed., 3120; USEPA SW 846 - 6010 The ICPAES technique ionises the 0.45um filtered sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)  Hardness parameters are calculated based on APHA 21st ed., 2340 B. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	(APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020): Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Fluoride by PC Titrator	EK040P	WATER	APHA 21st ed., 4500 F--C CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Ionic Balance by PCT DA and Turbi SO <sub>4</sub> DA	EN055 - PG	WATER	APHA 21st Ed. 1030F. The Ionic Balance is calculated based on the major Anions and Cations. The major anions include Alkalinity, Chloride and Sulfate which determined by PCT and DA. The Cations are determined by Turbi SO <sub>4</sub> by DA. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Analytical Methods	Method	Matrix	Method Descriptions
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
Volatile Organic Compounds	EP074	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)
TPH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) (Appdx. 2). ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

## Summary of Outliers

### Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

#### Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
<b>Matrix Spike (MS) Recoveries</b>							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES1324232-001	TE_MW15	Sulfate as SO4 - Turbidimetric	14808-79-8	Not Determined	----	<b>MS recovery not determined, background level greater than or equal to 4x spike level.</b>

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.
- For all matrices, no Laboratory Control outliers occur.

#### Regular Sample Surrogates

- For all regular sample matrices, no surrogate recovery outliers occur.

### Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- No Analysis Holding Time Outliers exist.

### Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- No Quality Control Sample Frequency Outliers exist.

Security Seal	: Intact.	No. of samples analysed	: 15

#### General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample containers do not comply to pretreatment / preservation standards (AS, APHA, USEPA). Please refer to the Sample Container(s)/Preservation Non-Compliance Log at the end of this report for details.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

### Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
<b>EG020A-F : Dissolved Metals by ICP-MS - Suite A</b>		
MG_X_4/D10	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered

RB_GW7_061113	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered

### Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

NATA Accredited Laboratory 825

Accredited for compliance with  
ISO/IEC 17025.

### *Signatories*

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Organics

---

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

- **EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEX compounds spiked at 20 ug/L.**
